This high quality material is endorsed by Edexcel and has been through a rigorous quality assurance programme to ensure it is a suitable companion to the specification for both learners and teachers. This does not mean that the contents will be used verbatim when setting examinations nor is it to be read as being the official specification – a copy of which is available at www.edexcel.org.uk

This book provides indicators of the equivalent grade level of maths questions throughout. The publishers wish to make clear that these grade indicators have been provided by Collins Education, and are not the responsibility of Edexcel Ltd. Whilst every effort has been made to assure their accuracy, they should be regarded as indicators, and are not binding or definitive.
William Collins’ dream of knowledge for all began with the publication of his first book in 1819. A self-educated mill worker, he not only enriched millions of lives, but also founded a flourishing publishing house. Today, staying true to this spirit, Collins books are packed with inspiration, innovation and a practical expertise. They place you at the centre of a world of possibility and give you exactly what you need to explore it.

Collins. Do more.

Welcome to Collins GCSE Maths, the easiest way to learn and succeed in Mathematics. This textbook uses a stimulating approach that really appeals to students. Here are some of the key features of the textbook, to explain why.

Each chapter of the textbook begins with an Overview. The Overview lists the Sections you will encounter in the chapter, the key ideas you will learn, and shows how these ideas relate to, and build upon, each other. The Overview also highlights what you should already know, and if you’re not sure, there is a short Quick Check activity to test yourself and recap.

Maths can be useful to us every day of our lives, so look out for these Really Useful Maths! pages. These double page spreads use big, bright illustrations to depict real-life situations, and present a short series of real-world problems for you to practice your latest mathematical skills on.

Each Section begins first by explaining what mathematical ideas you are aiming to learn, and then lists the key words you will meet and use. The ideas are clearly explained, and this is followed by several examples showing how they can be applied to real problems. Then it’s your turn to work through the exercises and improve your skills. Notice the different coloured panels along the outside of the exercise pages. These show the equivalent exam grade of the questions you are working on, so you can always tell how well you are doing.
Every chapter in this textbook contains lots of Exam Questions. These provide ideal preparation for your examinations. Each exam question section also concludes with a fully worked example. Compare this with your own work, and pay special attention to the examiner’s comments, which will ensure you understand how to score maximum marks.

Throughout the textbook you will find Activities – highlighted in the green panels – designed to challenge your thinking and improve your understanding.

Review the Grade Yourself pages at the very end of the chapter. This will show what exam grade you are currently working at. Doublecheck What you should now know to confirm that you have the knowledge you need to progress.

Working through these sections in the right way should mean you achieve your very best in GCSE Maths. Remember though, if you get stuck, answers to all the questions are at the back of the book (except the exam question answers which your teacher has).

We do hope you enjoy using Collins GCSE Maths, and wish you every good luck in your studies!

Brian Speed, Keith Gordon, Kevin Evans
ICONS

You may use your calculator for this question

You should not use your calculator for this question

Indicates a Using and Applying Mathematics question

Indicates a Proof question
This chapter will show you ...

- how to calculate with integers and decimals
- how to round off numbers to a given number of significant figures
- how to find prime factors, least common multiples (LCM) and highest common factors (HCF)

What you should already know

- How to add, subtract, multiply and divide with integers
- What multiples, factors, square numbers and prime numbers are
- The BODMAS rule and how to substitute values into simple algebraic expressions

Quick check

1. Work out the following.
   a. $23 \times 167$
   b. $984 \div 24$
   c. $(16 + 9)^2$

2. Write down the following.
   a. a multiple of 7
   b. a prime number between 10 and 20
   c. a square number under 80
   d. the factors of 9

3. Work out the following.
   a. $2 + 3 \times 5$
   b. $(2 + 3) \times 5$
   c. $2 + 3^2 - 6$
In your GCSE examination, you will be given real problems that you have to read carefully, think about and then plan a strategy without using a calculator. These will involve arithmetical skills such as long multiplication and long division. There are several ways to do these, so make sure you are familiar with and confident with at least one of them. The box method for long multiplication is shown in the first example and the standard column method for long division is shown in the second example. In this type of problem it is important to show your working as you will get marks for correct methods.

**Example 1**

A supermarket receives a delivery of 235 cases of tins of beans. Each case contains 24 tins.

a How many tins of beans does the supermarket receive altogether?

b 5% of the tins were damaged. These were thrown away. The supermarket knows that it sells, on average, 250 tins of beans a day. How many days will the delivery of beans last before a new consignment is needed?

**a** The problem is a long multiplication $235 \times 24$.

The box method is shown.

\[
\begin{array}{ccc}
\times & 200 & 30 & 5 \\
20 & 4000 & 600 & 100 \\
4 & 800 & 120 & 20 \\
\end{array}
\]

So the answer is $5640$ tins.

**b** 10% of $5640$ is $564$, so $5\%$ is $564 \div 2 = 282$

This leaves $5640 - 282 = 5358$ tins to be sold.

There are 21 lots of 250 in 5358 (you should know that $4 \times 250 = 1000$), so the beans will last for 21 days before another delivery is needed.
There are 48 cans of soup in a crate. A supermarket had a delivery of 125 crates of soup.

a How many cans of soup were received?

b The supermarket is having a promotion on soup. If you buy five cans you get one free. Each can costs 39p. How much will it cost to get 32 cans of soup?

Greystones Primary School has 12 classes, each of which has 24 pupils.

a How many pupils are there at Greystones Primary School?

b The pupil–teacher ratio is 18 to 1. That means there is one teacher for every 18 pupils. How many teachers are at the school?

Barnsley Football Club is organising travel for an away game. 1300 adults and 500 juniors want to go. Each coach holds 48 people and costs £320 to hire. Tickets to the match are £18 for adults and £10 for juniors.

a How many coaches will be needed?

b The club is charging adults £26 and juniors £14 for travel and a ticket. How much profit does the club make out of the trip?

First-class letters cost 30p to post. Second-class letters cost 21p to post. How much will it cost to send 75 first-class and 220 second-class letters?

Kirsty collects small models of animals. Each one costs 45p. She saves enough to buy 23 models but when she goes to the shop she finds that the price has gone up to 55p. How many can she buy now?

Eunice wanted to save up for a mountain bike that costs £250. She baby-sits each week for 6 hours for £2.75 an hour, and does a Saturday job that pays £27.50. She saves three-quarters of her weekly earnings. How many weeks will it take her to save enough to buy the bike?
The magazine *Teen Dance* comes out every month. In a newsagent the magazine costs £2.45. The annual (yearly) subscription for the magazine is £21. How much cheaper is each magazine bought on subscription?

Paula buys a music centre. She pays a deposit of 10% of the cash price and then 36 monthly payments of £12.50. In total she pays £495. How much was the cash price of the music centre?

### 1.2 Division by decimals

**This section will show you how to:**

- divide by decimals by changing the problem so you divide by an integer

**Key words**
- decimal places
- decimal point
- integer

It is advisable to change the problem so that you divide by an integer rather than a decimal. This is done by multiplying both numbers by 10 or 100, etc. This will depend on the number of decimal places after the decimal point.

**EXAMPLE 3**

Evaluate the following.

- **a** \(42 \div 0.2\)
  
  This calculation is \(42 \div 0.2\) which can be rewritten as \(420 \div 2\). In this case both values have been multiplied by 10 to make the divisor into a whole number. This is then a straightforward division to which the answer is 210.
  
  Another way to view this is as a fraction problem.
  
  \[
  \frac{42}{0.2} = \frac{42 \times 10}{0.2 \times 10} = \frac{420}{2} = \frac{210}{1} = 210
  \]

- **b** \(19.8 \div 0.55\)
  
  This then becomes a long division problem.
  
  \[
  \begin{array}{c|c}
  \hline
  \text{1980} & \text{110} \\
  \text{55} & \text{20 \times 55} \\
  \text{880} & \\
  \text{440} & \text{8 \times 55} \\
  \text{440} & \\
  \text{0} & \text{56 \times 55}
  \end{array}
  \]

**EXERCISE 1B**

Evaluate each of these.

- **a** \(3.6 \div 0.2\)
  
  - **b** \(56 \div 0.4\)
  
  - **c** \(0.42 \div 0.3\)
  
  - **d** \(8.4 \div 0.7\)
  
  - **e** \(4.26 \div 0.2\)
  
  - **f** \(3.45 \div 0.5\)
  
  - **g** \(83.7 \div 0.03\)
  
  - **h** \(0.968 \div 0.08\)
  
  - **i** \(7.56 \div 0.4\)

Evaluate each of these.

- **a** \(67.2 \div 0.24\)
  
  - **b** \(6.36 \div 0.53\)
  
  - **c** \(0.936 \div 5.2\)
  
  - **d** \(162 \div 0.36\)
  
  - **e** \(2.17 \div 3.5\)
  
  - **f** \(98.8 \div 0.26\)
  
  - **g** \(0.468 \div 1.8\)
  
  - **h** \(132 \div 0.35\)
  
  - **i** \(0.984 \div 0.082\)
A pile of paper is 6 cm high. Each sheet is 0.008 cm thick. How many sheets are in the pile of paper?

Doris buys a big bag of safety pins. The bag weighs 180 grams. Each safety pin weighs 0.6 grams. How many safety pins are in the bag?

### 1.3 Estimation

**This section will show you how to:**
- use estimation to find approximate answers to numerical calculations

**Key words**
- approximate
- estimation
- significant figures

#### Rounding off to significant figures

We often use significant figures when we want to approximate a number with quite a few digits in it.

Look at this table which shows some numbers rounded to one, two and three significant figures (sf).

<table>
<thead>
<tr>
<th>Number</th>
<th>Rounded to 1 sf</th>
<th>Rounded to 2 sf</th>
<th>Rounded to 3 sf</th>
</tr>
</thead>
<tbody>
<tr>
<td>45 281</td>
<td>45 000</td>
<td>45 000</td>
<td>45 000</td>
</tr>
<tr>
<td>568.54</td>
<td>570</td>
<td>570</td>
<td>569</td>
</tr>
<tr>
<td>7.3782</td>
<td>7.4</td>
<td>7.4</td>
<td>7.38</td>
</tr>
<tr>
<td>8054</td>
<td>8100</td>
<td>8100</td>
<td>8050</td>
</tr>
<tr>
<td>99.8721</td>
<td>100</td>
<td>100</td>
<td>99.9</td>
</tr>
<tr>
<td>0.7002</td>
<td>0.7</td>
<td>0.70</td>
<td>0.700</td>
</tr>
</tbody>
</table>

The steps taken to round off a number to a particular number of significant figures are very similar to those used for rounding to so many decimal places.

- From the left, count the digits. If you are rounding to 2 sf, count 2 digits, for 3 sf count 3 digits, and so on. When the original number is less than 1.0, start counting from the first non-zero digit.
- Look at the next digit to the right. When the next digit is less than 5, leave the digit you counted to the same. However if the next digit is equal to or greater than 5, add 1 to the digit you counted to.
- Ignore all the other digits, but put in enough zeros to keep the number the right size (value).

For example, look at the following table which shows some numbers rounded off to one, two and three significant figures, respectively.
Round off each of the following numbers to 1 significant figure.

- a 46 313
- b 57 123
- c 30 569
- d 94 558
- e 85 299
- f 0.5388
- g 0.2823
- h 0.005 84
- i 0.047 85
- j 0.000 876
- k 9.9
- l 89.5
- m 90.78
- n 199
- o 999.99

Round off each of the following numbers to 2 significant figures.

- a 56 147
- b 26 813
- c 79 611
- d 30 578
- e 14 009
- f 1.689
- g 4.0854
- h 2.658
- i 8.0089
- j 41.564
- k 0.8006
- l 0.458
- m 0.0658
- n 0.9996
- o 0.009 82

Round off each of the following to the number of significant figures (sf) indicated.

- a 57 402 (1 sf)
- b 5288 (2 sf)
- c 89.67 (3 sf)
- d 105.6 (2 sf)
- e 8.69 (1 sf)
- f 1.087 (2 sf)
- g 0.261 (1 sf)
- h 0.732 (1 sf)
- i 0.42 (1 sf)
- j 0.758 (1 sf)
- k 0.185 (1 sf)
- l 0.682 (1 sf)

What are the least and the greatest number of sweets that can be found in these jars?

- a 70 sweets (to 1 sf)
- b 100 sweets (to 1 sf)
- c 1000 sweets (to 1 sf)

What are the least and the greatest number of people that can be found in these towns?

- Elsecar population 800 (to 1 significant figure)
- Hoyland population 1200 (to 2 significant figures)
- Barnsley population 165 000 (to 3 significant figures)

Multiplying and dividing by multiples of 10

Questions often use multiplying together multiples of 10, 100, and so on. This method is used in estimation. You should have the skill to do this mentally so that you can check that your answers to calculations are about right. (Approximation of calculations is covered on page 7.)

Use a calculator to work out the following.

- a 200 \times 300 =
- b 100 \times 40 =
- c 2000 \times 0.3 =
- d 0.2 \times 50 =
- e 0.2 \times 0.5 =
- f 0.3 \times 0.04 =

Can you see a way of doing these without using a calculator or pencil and paper? Basically, the digits are multiplied together and then the number of zeros or the position of the decimal point is worked out by combining the zeros or decimal places on the original calculation.

Dividing is almost as simple. Try doing the following on your calculator.

- \( 400 \div 20 = \)
- \( 200 \div 50 = \)
- \( 1000 \div 0.2 = \)
- \( 300 \div 0.3 = \)
- \( 250 \div 0.05 = \)
- \( 30000 \div 0.6 = \)

Once again, there is an easy way of doing these “in your head”. Look at these examples.

- \( 300 \times 4000 = 1200000 \)
- \( 5000 \div 200 = 25 \)
- \( 20 \times 0.5 = 10 \)
- \( 0.6 \times 5000 = 3000 \)
- \( 400 \div 0.02 = 20000 \)
- \( 800 \div 0.2 = 4000 \)

Can you see a connection between the digits, the number of zeros and the position of the decimal point, and the way in which these calculations are worked out?

**EXERCISE 1D**

**ANSWERS**

Without using a calculator, write down the answers to these.

- \( a \) 200 \times 300
- \( b \) 30 \times 4000
- \( c \) 50 \times 200
- \( d \) 0.3 \times 50
- \( e \) 200 \times 0.7
- \( f \) 200 \times 0.5
- \( g \) 0.1 \times 2000
- \( h \) 0.2 \times 0.14
- \( i \) 0.3 \times 0.3
- \( j \) \((20)^3\)
- \( k \) \((20)^3\)
- \( l \) \((0.4)^2\)
- \( m \) 0.3 \times 150
- \( n \) 0.4 \times 0.2
- \( o \) 0.5 \times 0.5
- \( p \) 20 \times 40 \times 5000
- \( q \) 20 \times 20 \times 900

Without using a calculator, write down the answers to these.

- \( a \) 2000 \div 400
- \( b \) 3000 \div 60
- \( c \) 5000 \div 200
- \( d \) 300 \div 0.5
- \( e \) 2100 \div 0.7
- \( f \) 2000 \div 0.4
- \( g \) 3000 \div 1.5
- \( h \) 400 \div 0.2
- \( i \) 2000 \div 40 \div 200
- \( j \) 200 \times 20 \div 0.5
- \( k \) 200 \times 6000 \div 0.3
- \( l \) 20 \times 80 \times 60 \div 0.03

**Approximation of calculations**

How do we approximate the value of a calculation? What do we actually do when we try to approximate an answer to a problem?

For example, what is the approximate answer to 35.1 \times 6.58?

To approximate the answer in this and many other similar cases, we simply round off each number to 1 significant figure, then work out the calculation. So in this case, the approximation is

\[ 35.1 \times 6.58 = 40 \times 7 = 280 \]
Sometimes, especially when dividing, we round off a number to something more useful at 2 significant figures instead of at 1 significant figure. For example,

\[ 57.3 \div 6.87 \]

Since 6.87 rounds off to 7, then round off 57.3 to 56 because 7 divides exactly into 56. Hence,

\[ 57.3 \div 6.87 \approx 56 \div 7 = 8 \]

A quick approximation is always a great help in any calculation since it often stops you writing down a silly answer.

If you are using a calculator, whenever you see a calculation with a numerator and denominator always put brackets around the top and the bottom. This is to remind you that the numerator and denominator must be worked out separately before they are divided into each other. You can work out the numerator and denominator separately but most calculators will work out the answer straight away if brackets are used. You are expected to use a calculator efficiently, so doing the calculation in stages is not efficient.

**EXAMPLE 4**

**a** Find approximate answers to

1. \[
\frac{213 \times 69}{42} \]

2. \[
\frac{78 \times 397}{0.38} \]

**b** Use your calculator to find the correct answer. Round off to 3 significant figures.

**a i** Round each value to 1 significant figure.

\[
\frac{200 \times 70}{40} = 350
\]

**b** Use a calculator to check your approximate answers.

1. So type in

\[
( 2 1 3 \times 6 9 ) \div ( 4 2 ) =
\]

The display should say 349.9285714 which rounds off to 350. This agrees exactly with the estimate.

Note that we do not have to put brackets around the 42 but it is a good habit to get into.

2. So type in

\[
( 7 8 \times 3 9 7 ) \div ( 0 . 3 8 ) =
\]

The display should say 81489.47368 which rounds off to 81 500. This agrees with the estimate.
Find approximate answers to the following.

a \( 5435 \times 7.31 \)

b \( 5280 \times 3.211 \)

c \( 63.24 \times 3.514 \times 4.2 \)

d \( 354 \div 79.8 \)

\( 5974 \div 5.29 \)

\( 208 \div 0.378 \)

Work out the answers to question 1 using a calculator. Round off your answers to 3 significant figures and compare them with the estimates you made.

By rounding off, find an approximate answer to these.

\( \frac{573 \times 783}{107} \)

\( \frac{783 - 572}{24} \)

\( \frac{352 + 657}{999} \)

d \( \frac{78.3 - 22.6}{2.69} \)

\( \frac{3.82 \times 7.95}{9.9} \)

\( \frac{11.78 \times 61.8}{39.4} \)

Work out the answers to question 3 using a calculator. Round off your answers to 3 significant figures and compare them with the estimates you made.

Find the approximate monthly pay of the following people whose annual salary is given.

a Paul £35 200

b Michael £25 600

c Jennifer £18 125

d Ross £8420

Find the approximate annual pay of the following people whose earnings are shown.

a Kevin £270 a week

b Malcolm £1528 a month

c David £347 a week

A farmer bought 2713 kg of seed at a cost of £7.34 per kg. Find the approximate total cost of this seed.

A greengrocer sells a box of 450 oranges for £37. Approximately how much did each orange sell for?

It took me 6 hours 40 minutes to drive from Sheffield to Bude, a distance of 295 miles. My car uses petrol at the rate of about 32 miles per gallon. The petrol cost £3.51 per gallon.

a Approximately how many miles did I do each hour?

b Approximately how many gallons of petrol did I use in going from Sheffield to Bude?

c What was the approximate cost of all the petrol I used in the journey to Bude and back again?

By rounding off, find an approximate answer to these.

\( \frac{462 \times 79}{0.42} \)

\( \frac{583 - 213}{0.21} \)

\( \frac{252 + 551}{0.78} \)

\( \frac{296 \times 32}{0.325} \)

e \( \frac{297 + 712}{0.578 - 0.321} \)

f \( \frac{893 \times 87}{0.698 \times 0.47} \)

g \( \frac{38.3 + 27.5}{0.776} \)

h \( \frac{29.7 + 12.6}{0.26} \)

i \( \frac{4.93 \times 3.81}{0.38 \times 0.51} \)

j \( \frac{12.31 \times 16.9}{0.394 \times 0.216} \)
Work out the answers to question 10 using a calculator. Round off your answers to 3 significant figures and compare them with the estimates you made.

A sheet of paper is 0.012 cm thick. Approximately how many sheets will there be in a pile of paper that is 6.35 cm deep?

Use your calculator to work out the following. In each case:

i. write down the full calculator display of the answer
ii. round your answer to three significant figures.

\[
\begin{align*}
a &= \frac{12.3 + 64.9}{6.9 - 4.1} \\
b &= \frac{13.8 \times 23.9}{3.2 \times 6.1} \\
c &= \frac{48.2 + 58.9}{3.62 \times 0.042}
\end{align*}
\]

Sensible rounding

In the GCSE you will be required to round off answers to problems to a suitable degree of accuracy. Normally three significant figures is acceptable for answers. However, a big problem is caused by rounding off during calculations. When working out values, always work to either the calculator display or at least four significant figures.

Generally, you can use common sense. For example, you would not give the length of a pencil as 14.574 cm; you would round off to something like 14.6 cm. If you were asked how many tins of paint you need to buy to do a particular job, then you would give a whole number answer and not something such as 5.91 tins.

It is hard to make rules about this, as there is much disagreement even among the experts as to how you ought to do it. But, generally, when you are in any doubt as to how many significant figures to use for the final answer to a problem, round off to no more than one extra significant figure to the number used in the original data. (This particular type of rounding is used throughout this book.)

In a question where you are asked to give an answer to a sensible or appropriate degree of accuracy then use the following rule. Give the answer to the same accuracy as the numbers in the question. So, for example, if the numbers in the question are given to 2 significant figures give your answer to 2 significant figures, but remember, unless working out an approximation, do all the working to at least 4 significant figures or use the calculator display.

Round off each of the following figures to a suitable degree of accuracy.

a. I am 1.7359 metres tall.

b. It took me 5 minutes 44.83 seconds to mend the television.

c. My kitten weighs 237.97 grams.

d. The correct temperature at which to drink Earl Grey tea is 82.739 °C.

e. There were 34 827 people at the test match yesterday.

f. The distance from Wath to Sheffield is 15.528 miles.

g. The area of the floor is 13.673 m².
Rewrite the following article, rounding off all the numbers to a suitable degree of accuracy if they need to be.

It was a hot day, the temperature was 81.699 °F and still rising. I had now walked 5.3289 km in just over 113.98 minutes. But I didn’t care since I knew that the 43,275 people watching the race were cheering me on. I won by clipping 6.2 seconds off the record time. This was the 67th time it had happened since records first began in 1788. Well, next year I will only have 15 practice walks beforehand as I strive to beat the record by at least another 4.9 seconds.

About how many test tubes each holding 24 cm³ of water can be filled from a 1 litre flask?

If I walk at an average speed of 70 metres per minute, approximately how long will it take me to walk a distance of 3 km?

About how many stamps at 21p each can I buy for £12?

I travelled a distance of 450 miles in 6.4 hours. What was my approximate average speed?

At Manchester United, it takes 160 minutes for 43,500 fans to get into the ground. On average, about how many fans are let into the ground every minute?

A 5p coin weighs 4.2 grams. Approximately how much will one million pounds worth of 5p pieces weigh?

You should remember the following.

**Multiples:** Any number in the times table. For example, the multiples of 7 are 7, 14, 21, 28, 35, etc.

**Factors:** Any number that divides exactly into another number. For example, factors of 24 are 1, 2, 3, 4, 6, 8, 12, 24.

**Prime numbers:** Any number that only has two factors, 1 and itself. For example, 11, 17, 37 are prime numbers.

**Square numbers:** A number that comes from multiplying a number by itself. For example, 1, 4, 9, 16, 25, 36 … are square numbers.

**Triangular numbers:** Numbers that can make triangle patterns. For example, 1, 3, 6, 10, 15, 21, 28 … are triangular numbers.
**Square roots:** The square root of a given number is a number which, when multiplied by itself, produces the given number. For example, the square root of 9 is 3, since \(3 \times 3 = 9\).

A square root is represented by the symbol \(\sqrt{\cdot}\). For example, \(\sqrt{16} = 4\).

Because \(-4 \times -4 = 16\), there are always two square roots of every positive number.

So \(\sqrt{16} = +4\) or \(-4\). This can be written as \(\sqrt{16} = \pm 4\), which is read as plus or minus four.

**Cube roots:** The cube root of a number is the number that when multiplied by itself three times gives the number. For example, the cube root of 27 is 3 and the cube root of \(-8\) is \(-2\).

---

**EXERCISE 1G**

From this box choose the numbers that fit each of these descriptions. (One number per description.)

**a** A multiple of 3 and a multiple of 4.

**b** A square number and an odd number.

**c** A factor of 24 and a factor of 18.

**d** A prime number and a factor of 39.

**e** An odd factor of 30 and a multiple of 3.

**f** A number with four factors and a multiple of 2 and 7.

**g** A number with five factors exactly.

**h** A triangular number and a factor of 20.

**i** An even number and a factor of 36 and a multiple of 9.

**j** A prime number that is one more than a square number.

**k** If you write the factors of this number out in order they make a number pattern in which each number is twice the one before.

**l** An odd triangular number that is a multiple of 7.

---

If hot-dog sausages are sold in packs of 10 and hot-dog buns are sold in packs of 8, how many of each do you have to buy to have complete hot dogs with no wasted sausages or buns?

Rover barks every 8 seconds and Spot barks every 12 seconds. If they both bark together, how many seconds will it be before they both bark together again?

A bell chimes every 6 seconds. Another bell chimes every 5 seconds. If they both chime together, how many seconds will it be before they both chime together again?

Copy these sums and write out the next four lines.

\[
1 = 1 \\
1 + 3 = 4 \\
1 + 3 + 5 = 9 \\
1 + 3 + 5 + 7 = 16
\]
Write down the negative square root of each of these.

\[ \begin{align*}
    a &= 4 & b &= 25 & c &= 49 & d &= 1 & e &= 81 \\
    f &= 121 & g &= 144 & h &= 400 & i &= 900 & j &= 169
\end{align*} \]

Write down the cube root of each of these.

\[ \begin{align*}
    a &= 1 & b &= 27 & c &= 64 & d &= 8 & e &= 1000 \\
    f &= -8 & g &= -1 & h &= 8000 & i &= 64000 & j &= -64
\end{align*} \]

The triangular numbers are 1, 3, 6, 10, 15, 21 …

\[ \begin{align*}
    a & \text{ Continue the sequence until the triangular number is greater than 100.} \\
    b & \text{ Add up consecutive pairs of triangular numbers starting with } 1 + 3 = 4, 3 + 6 = 9, \text{ etc. What do you notice?}
\end{align*} \]

\[ a \ 36^3 = 46656. \text{ Work out } 1^3, 4^3, 9^3, 16^3, 25^3. \]

\[ b \ \sqrt{46656} = 216. \text{ Use a calculator to find the square roots of the numbers you worked out in part } a. \]

\[ c \ 216 = 36 \times 6. \text{ Can you find a similar connection between the answer to part } b \text{ and the numbers cubed in part } a? \]

\[ d \ What \ type \ of \ numbers \ are \ 1, 4, 9, 16, 25, 36? \]

Write down the values of these

\[ \begin{align*}
    a &= \sqrt{0.04} & b &= \sqrt{0.25} & c &= \sqrt{0.36} & d &= \sqrt{0.81} \\
    e &= \sqrt{1.44} & f &= \sqrt{0.64} & g &= \sqrt{1.21} & h &= \sqrt{2.25}
\end{align*} \]

Estimate the answers to these.

\[ \begin{align*}
    a &= \frac{13.7 + 21.9}{\sqrt{0.239}} & b &= \frac{29.6 \times 11.9}{\sqrt{0.038}} & c &= \frac{87.5 - 32.6}{\sqrt{0.8 - \sqrt{0.38}}}
\end{align*} \]
Start with a number – say 110 – and find two numbers which, when multiplied together, give that number, for example, $2 \times 55$. Are they both prime? No. So take 55 and repeat the operation, to get $5 \times 11$. Are these prime? Yes. So:

$$110 = 2 \times 5 \times 11$$

These are the **prime factors** of 110.

This method is not very logical and needs good tables skills. There are, however, two methods that you can use to make sure you do not miss any of the prime factors.

The next two examples show you how to use the first of these methods.

### EXAMPLE 5

Find the prime factors of 24.

Divide 24 by any prime number that goes into it. (2 is an obvious choice.)

Divide the answer (12) by a prime number. Repeat this process until you have a prime number as the answer.

So the prime factors of 24 are $2 \times 2 \times 2 \times 3$.

A quicker and neater way to write this answer is to use index notation, expressing the answer in powers. (Powers are dealt with in Chapter 10.)

In index notation, the prime factors of 24 are $2^3 \times 3$.

### EXAMPLE 6

Find the prime factors of 96.

So, the prime factors of 96 are $2 \times 2 \times 2 \times 2 \times 2 \times 3 = 2^5 \times 3$. 

The second method is called prime factor trees. You start by splitting the number into a multiplication sum. Then you split this, and carry on splitting until you get to prime numbers.

**EXAMPLE 7**

Find the prime factors of 76.

We stop splitting the factors here because 2, 2 and 19 are all prime numbers.

So, the prime factors of 76 are \(2 \times 2 \times 19 = 2^2 \times 19\).

**EXAMPLE 8**

Find the prime factors of 420.

The process can be done upside down to make an upright tree.

So, the prime factors of 420 are \(2 \times 5 \times 2 \times 3 \times 7 = 2^2 \times 3 \times 5 \times 7\).

**EXERCISE 1H**

Copy and complete these prime factor trees.
Using index notation, for example,

\[ 100 = 2 \times 2 \times 5 \times 5 = 2^2 \times 5^2 \]

and

\[ 540 = 2 \times 2 \times 3 \times 3 \times 3 \times 5 = 2^2 \times 3^3 \times 5 \]

rewrite the answers to question 1 parts a to g.

Write the numbers from 1 to 50 in prime factors. Use index notation. For example,

\[ 1 = 1 \quad 2 = 2 \quad 3 = 3 \quad 4 = 2^2 \quad 5 = 5 \quad 6 = 2 \times 3 \quad \ldots \]

a. What is special about the prime factors of 2, 4, 8, 16, 32, \ldots?

b. What are the next two terms in this sequence?

c. What are the next three terms in the sequence 3, 9, 27, \ldots?

d. Continue the sequence 4, 16, 64, \ldots, for three more terms.

e. Write all the above sequences in index notation. For example, the first sequence is

\[ 2, 2^2, 2^3, 2^4, 2^5, 2^6, 2^7, \ldots \]
Least common multiple

The least (or lowest) common multiple (usually called the LCM) of two numbers is the smallest number that belongs in both times tables.

For example the LCM of 3 and 5 is 15, the LCM of 2 and 7 is 14 and the LCM of 6 and 9 is 18.

There are two ways of working out the LCM.

Example 9

Find the LCM of 18 and 24.

- Write out the 18 times table: 18, 36, 54, 72, 90, 108, ….
- Write out the 24 times table: 24, 48, 72, 96, 120, …

You can see that 72 is the smallest (least) number in both (common) tables (multiples).

Example 10

Find the LCM of 42 and 63.

- Write 42 in prime factor form: $42 = 2 \times 3 \times 7$
- Write 63 in prime factor form: $63 = 3^2 \times 7$
- Write down the smallest number in prime factor form that includes all the prime factors of 42 and of 63.
- You need $2 \times 3^2 \times 7$ (this includes $2 \times 3 \times 7$ and $3^2 \times 7$).
- Then work it out.
- $2 \times 3^2 \times 7 = 2 \times 9 \times 7 = 18 \times 7 = 126$
- The LCM of 42 and 63 is 126.

Highest common factor

The highest common factor (usually called the HCF) of two numbers is the biggest number that divides exactly into both of them.

For example the HCF of 24 and 18 is 6, the HCF of 45 and 36 is 9 and the HCF of 15 and 22 is 1.

There are two ways of working out the HCF.

Example 11

Find the HCF of 28 and 16.

- Write out the factors of 28: 1, 2, 4, 7, 14, 28
- Write out the factors of 16: 1, 2, 4, 8, 16

You can see that 4 is the biggest (highest) number in both (common) lists (factors).
Find the LCM of each of these pairs of numbers.

a 4 and 5  

b 7 and 8  

c 2 and 3  

d 4 and 7  

e 2 and 5  

f 3 and 5  

g 3 and 8  

h 5 and 6  

What connection is there between the LCM and the pairs of numbers in question 1?

Find the LCM of each of these pairs of numbers.

a 4 and 8  

b 6 and 9  

c 4 and 6  

d 10 and 15  

Does the same connection you found in question 2 still work for the numbers in question 3? If not, can you explain why?

Find the LCM of each of these pairs of numbers.

a 24 and 56  

b 21 and 35  

c 12 and 28  

d 28 and 42  

e 12 and 48  

f 18 and 27  

g 15 and 25  

h 16 and 36  

Find the HCF of each of these pairs of numbers.

a 24 and 56  

d 28 and 42  

b 21 and 35  

c 12 and 28  

e 12 and 48  

f 18 and 27  

g 15 and 25  

h 16 and 36  

i 42 and 27  

d 28 and 42  

j 48 and 64  

k 25 and 35  

l 36 and 54  

In prime factor form 1250 = 2 × 5^4 and 525 = 3 × 5^2 × 7.

a Which of these are common multiples of 1250 and 525?

i 2 × 3 × 5^3 × 7  

ii 2^3 × 3 × 5^4 × 7^2  

iii 2 × 3 × 5^4 × 7  

iv 2 × 3 × 5 × 7  

b Which of these are common factors of 1250 and 525?

i 2 × 3  

ii 2 × 5  

iii 5^2  

iv 2 × 3 × 5 × 7
Multiplying and dividing with negative numbers

The rules for multiplying and dividing with negative numbers are very easy.

- When the signs of the numbers are the same, the answer is positive.
- When the signs of the numbers are different, the answer is negative.

Here are some examples.

\[
2 \times 4 = 8 \quad 12 \div -3 = -4 \\
-2 \times -3 = 6 \quad -12 \div -3 = 4
\]

Negative numbers on a calculator

You can enter a negative number into your calculator and check the result.

Enter \(-5\) by pressing the keys \(5\) and \(\text{+/-}\). (You may need to press \(\text{+/-}\) or \(-\) followed by \(5\), depending on the type of calculator that you have.) You will see the calculator shows \(-5\).

Now try these two calculations.

\[-8 - 7 \rightarrow \boxed{8} \text{+/-} \boxed{-} \boxed{7} = -15 \\
6 - -3 \rightarrow \boxed{6} \text{+/-} \boxed{-} \boxed{3} = 9
\]

EXERCISE 1J

Write down the answers to the following.

1. \(a\) \(-3 \times 5\) \(b\) \(-2 \times 7\) \(c\) \(-4 \times 6\) \(d\) \(-2 \times -3\) \(e\) \(-7 \times -2\)
2. \(f\) \(-12 \div -6\) \(g\) \(-16 \div 8\) \(h\) \(24 \div -3\) \(i\) \(16 \div -4\) \(j\) \(-6 \div -2\)
3. \(k\) \(4 \times -6\) \(l\) \(5 \times -2\) \(m\) \(6 \times -3\) \(n\) \(-2 \times -8\) \(o\) \(-9 \times -4\)

Write down the answers to the following.

1. \(a\) \(-3 + -6\) \(b\) \(-2 \times -8\) \(c\) \(2 + -5\) \(d\) \(8 \times -4\) \(e\) \(-36 \div -2\)
2. \(f\) \(-3 \times -6\) \(g\) \(-3 - -9\) \(h\) \(48 \div -12\) \(i\) \(-5 \times -4\) \(j\) \(7 - -9\)
3. \(k\) \(-40 \div -5\) \(l\) \(-40 + -8\) \(m\) \(4 - -9\) \(n\) \(5 - 18\) \(o\) \(72 \div -9\)

What number do you multiply –3 by to get the following?

a 6  

b –90  

c –45  

d 81  

e 21  

Evaluate the following.

a –6 + (4 – 7)  

b –3 – (–9 – 3)  

c 8 + (2 – 9)  

Evaluate the following.

a 4 × (–8 ÷ –2)  

b –8 – (3 × –2)  

c –1 × (8 – –4)  

Write down six different division sums that give the answer –4.

Hierarchy of operations

You will remember BODMAS (Brackets, Order, Division, Multiplication, Addition, Subtraction) which tells you the order in which to do mathematical operations in complex calculations. Many errors are made in GCSE due to negative signs and doing calculations in the wrong order. For example –6² could be taken as (–6)² = +36 or –(6²) = –36. It should be the second of these as the power (order) would come before the minus sign.

Work out each of these. Remember to work out the bracket first.

a –2 × (–3 + 5) =  

b 6 ÷ (–2 + 1) =  

c (5 – 7) × –2 =  

d –5 × (–7 – 2) =  

e –3 × (–4 ÷ 2) =  

f –3 × (–4 + 2) =  

Work out each of these.

a –6 × –6 + 2 =  

b –6 × (–6 + 2) =  

c –6 ÷ 6 – 2 =  

d 12 ÷ (–4 + 2) =  

e 12 ÷ (–4 + 2) =  

f 2 × (–3 + 4) =  

g –(5)² =  

h (–5)² =  

i (–1 + 3)² – 4 =  

j (–1 + 3)² – 4 =  

k –1 + 3² – 4 =  

l –1 + (3 – 4)² =  

Copy each of these and then put in brackets where necessary to make each one true.

a 3 × –4 + 1 = –11  

b –6 ÷ –2 + 1 = 6  

c –6 ÷ –2 + 1 = 4  

d 4 ÷ (–4 ÷ 4) = 3  

e 4 ÷ (–4 ÷ 4) = 0  

f 16 – (–4 ÷ 2) = 10  

a = –2, b = 3, c = –5.

Work out the values of the following.

a (a + c)²  

b –(a + b)²  

c (a + b)c  

d a² + b² – c²
Frank earns £12 per hour. He works for 40 hours per week. He saves \( \frac{3}{5} \) of his earnings each week. How many weeks will it take him to save £500?

A floor measures 4.75 metres by 3.5 metres. It is to be covered with square carpet tiles of side 25 centimetres. Tiles are sold in boxes of 16. How many boxes are needed?

As the product of prime factors 60 = \(2^2 \times 3 \times 5\)

a) What number is represented by \(2 \times 3^2 \times 5\)?

b) Find the lowest common multiple (LCM) of 60 and 48?

c) Find the highest common factor (HCF) of 60 and 78?

Use your calculator to work out the value of

\[
\frac{212 \times 7.88}{0.365}
\]

Mary set up her Christmas tree with two sets of twinkling lights.
Set A would twinkle every 3 seconds.
Set B would twinkle every 4 seconds.
How many times in a minute will both sets be twinkling at the same time?

You are given that \(8x^3 = 1000\).
Find the value of \(x\).

Write 150 as the product of its prime factors.

\[ p \text{ and } q \text{ are prime numbers such that } pq^2 = 250\]
Find the values of \(p\) and \(q\).

Find the highest common factor of 250 and 80.

The number 40 can be written as \(2^m \times n\), where \(m\) and \(n\) are prime numbers. Find the value of \(m\) and the value of \(n\).

Use approximations to estimate the value of

\[
\frac{212 \times 7.88}{0.365}
\]

Use your calculator to work out the value of

\[
6.27 \times 4.52
\]

\[
4.81 + 9.63
\]

a) Write down all the figures on your calculator display.

b) Write your answer to part a to an appropriate degree of accuracy.

Estimate the result of the calculation

\[
\frac{195.71 - 53.62}{\sqrt{0.0375}}
\]

Show the estimates you make.

**Solution**

\[
\begin{align*}
200 - 50 &= 150 \\
\sqrt{0.04} &= 0.2 \\
150 \div 0.2 &= 750
\end{align*}
\]

First round off each number to 1 significant figure.

Work out the numerator and do the square root in the denominator.

Change the problem so it becomes division by an integer.
GRADE YOURSELF

- Able to recognise and work out multiples, factors and primes
- Able to multiply and divide with negative numbers
- Able to estimate the values of calculations involving positive numbers bigger than one
- Able to round numbers to a given number of significant figures
- Able to estimate the values of calculations involving positive numbers between zero and one
- Able to write a number as the product of its prime factors
- Able to work out the LCM and HCF of pairs of numbers
- Able to use a calculator efficiently and know how to give answers to an appropriate degree of accuracy
- Able to work out the square roots of some decimal numbers
- Able to estimate answers involving the square roots of decimals

What you should know now
- How to solve complex real-life problems without a calculator
- How to divide by decimals of up to two decimal places
- How to estimate the values of calculations including those with decimal numbers, and use a calculator efficiently
- How to write a number in prime factor form and find LCMs and HCFs
- How to find the square roots of some decimal numbers
This chapter will show you ...

- how to apply the four rules (addition, subtraction, multiplication and division) to fractions
- how to calculate the final value after a percentage increase or decrease
- how to calculate compound interest
- how to calculate the original value after a percentage increase or decrease

What you should already know

- How to cancel down fractions to their simplest form
- How to find equivalent fractions, decimals and percentages
- How to add and subtract fractions with the same denominator
- How to work out simple percentages, such as 10%, of quantities
- How to convert a mixed number to a top-heavy fraction and vice versa

Quick check

1. Cancel down the following fractions to their simplest form.
   - \( \frac{2}{3} \)
   - \( \frac{1}{2} \)
   - \( \frac{3}{5} \)

2. Complete this table of equivalences.

<table>
<thead>
<tr>
<th>Fraction</th>
<th>Percentage</th>
<th>Decimal</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \frac{1}{4} )</td>
<td>40%</td>
<td>0.55</td>
</tr>
</tbody>
</table>

3. What is 10% of
   - \( £230 \)
   - \( £46.00 \)
   - \( £2.30 \)
An amount often needs to be given as a **fraction** of another amount.

**EXAMPLE 1**

Write £5 as a fraction of £20.

As a fraction this is written $\frac{5}{20}$. This **cancels** down to $\frac{1}{4}$.

**EXERCISE 2A**

Find the first quantity as a fraction of the second.

<table>
<thead>
<tr>
<th>a</th>
<th>2 cm, 6 cm</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>4 kg, 20 kg</td>
</tr>
<tr>
<td>c</td>
<td>£8, £20</td>
</tr>
<tr>
<td>d</td>
<td>5 hours, 24 hours</td>
</tr>
<tr>
<td>e</td>
<td>12 days, 30 days</td>
</tr>
<tr>
<td>f</td>
<td>50p, £3</td>
</tr>
<tr>
<td>g</td>
<td>4 days, 2 weeks</td>
</tr>
<tr>
<td>h</td>
<td>40 minutes, 2 hours</td>
</tr>
</tbody>
</table>

In a form of 30 pupils, 18 are boys. What fraction of the form consists of boys?

During March, it rained on 12 days. For what fraction of the month did it rain?

Linda wins £120 in a competition. She keeps some to spend and puts £50 into her bank account. What fraction of her winnings does she keep to spend?

Frank gets a pay rise from £120 a week to £135 a week. What fraction of his original pay was his pay rise?

When she was born Alice had a mass of 3 kg. After a month she had a mass of 4 kg 250 g. What fraction of her original mass had she increased by?

After the breeding season a bat colony increased in size from 90 bats to 108 bats. What fraction had the size of the colony increased by?

After dieting Bart went from 80 kg to 68 kg. What fraction did his weight decrease by?
Fractions can only be added or subtracted after we have changed them to equivalent fractions, both having the same denominator.

### EXAMPLE 2

Work out \( \frac{5}{6} - \frac{2}{3} \).

The lowest common denominator of 4 and 6 is 12.

The problem becomes \( \frac{5}{6} \times \frac{2}{2} - \frac{2}{3} \times \frac{3}{3} = \frac{10}{12} - \frac{6}{12} = \frac{4}{12} = \frac{1}{3} \).  

### EXAMPLE 3

Work out

- **a** \( 2\frac{1}{3} + 3\frac{3}{7} \)
- **b** \( 3\frac{1}{2} - 1\frac{5}{6} \)

The best way to deal with addition and subtraction of mixed numbers is to deal with the whole numbers and the fractions separately.

- **a** \( 2\frac{1}{3} + 3\frac{3}{7} = 2 + 3 + \frac{1}{3} + \frac{3}{7} = 5 + \frac{7 + 9}{21} = 5 + \frac{16}{21} = 5\frac{16}{21} \)
- **b** \( 3\frac{1}{2} - 1\frac{5}{6} = 3 - 1 + \frac{1}{2} - \frac{5}{6} = 2 + \frac{3 - 5}{6} = 2 - \frac{2}{6} = 1\frac{5}{6} \)

### EXERCISE 2B

**Evaluate the following.**

- **a** \( \frac{1}{3} + \frac{1}{5} \)
- **b** \( \frac{1}{4} + \frac{1}{6} \)
- **c** \( \frac{1}{5} + \frac{6}{15} \)
- **d** \( \frac{3}{8} + \frac{1}{3} \)
- **e** \( \frac{1}{3} - \frac{5}{15} \)
- **f** \( \frac{7}{8} - \frac{3}{4} \)
- **g** \( \frac{5}{6} - \frac{1}{2} \)
- **h** \( \frac{5}{6} - \frac{3}{5} \)

**Evaluate the following.**

- **a** \( \frac{1}{3} + \frac{3}{6} \)
- **b** \( \frac{1}{4} + \frac{3}{8} \)
- **c** \( \frac{7}{8} - \frac{6}{8} \)
- **d** \( \frac{3}{8} - \frac{1}{8} \)
- **e** \( 1\frac{7}{16} + 2\frac{1}{10} \)
- **f** \( 3\frac{1}{8} + 1\frac{5}{8} \)
- **g** \( 1\frac{1}{8} - \frac{5}{8} \)
- **h** \( 1\frac{5}{16} - \frac{7}{12} \)
- **i** \( \frac{5}{6} + \frac{7}{6} + \frac{5}{6} \)
- **j** \( \frac{7}{10} + \frac{2}{5} + \frac{5}{6} \)
- **k** \( 1\frac{1}{3} + \frac{7}{10} - \frac{5}{15} \)
- **l** \( \frac{5}{16} + 1\frac{3}{5} - \frac{3}{5} \)
In a class of children, three-quarters are Chinese, one-fifth are Malay and the rest are Indian. What fraction of the class are Indian?

In a class election, half of the pupils voted for Aminah, one-third voted for Janet and the rest voted for Peter. What fraction of the class voted for Peter?

A one-litre flask filled with milk is used to fill two glasses, one of capacity half a litre, and the other of capacity one-sixth of a litre. What fraction of a litre will remain in the flask?

Because of illness, ⅔ of a school was absent one day. If the school had 650 pupils on the register, how many were absent that day?

Which is the biggest: half of 96, one-third of 141, two-fifths of 120, or three-quarters of 68?

To increase sales, a shop reduced the price of a car stereo radio by ⅕. If the original price was £85, what was the new price?

At a burger-eating competition, Lionel ate 34 burgers in 20 minutes while Brian ate 26 burgers in 20 minutes. How long after the start of the competition would they have consumed a total of 30 burgers between them?

### 2.3 Multiplying fractions

This section will show you how to:
- multiply fractions

Key words
- cancel
- denominator
- numerator

There are four steps to multiplying fractions.

**Step 1:** make any mixed numbers into top-heavy fractions.

**Step 2:** cancel out any common multiples on the top and bottom.

**Step 3:** multiply together the **numerator**s to get the new numerator, and multiply the **denominator**s to get the new denominator.

**Step 4:** if the fraction is top-heavy, make it into a mixed number.
EXAMPLE 4

Work out \( \frac{4}{9} \times \frac{3}{10} \) \( \frac{2}{3} \times \frac{1}{2} \)

a 4 and 10 are both multiples of 2, and 3 and 9 are both multiples of 3. Cancel out the common multiples before multiplying.
\[
\frac{2 \times 3}{3 \times 5} \times \frac{3 \times 1}{1 \times 2} = \frac{2}{5}
\]
b Make the mixed numbers into top heavy fractions, then cancel if possible. Change the answer back to a mixed number.
\[
2 \frac{2}{5} \times 1 \frac{7}{5} = \frac{3 \times 2}{1 \times 4} \times \frac{12}{8} = \frac{9}{2} = 4 \frac{1}{2}
\]

EXERCISE 2C

Evaluate the following, leaving your answers in their simplest form.

\[
\begin{align*}
a & \quad \frac{1}{2} \times \frac{1}{2} & b & \quad \frac{1}{4} \times \frac{1}{4} & c & \quad \frac{3}{4} \times \frac{1}{2} & d & \quad \frac{3}{7} \times \frac{1}{2} \\
e & \quad \frac{1}{3} \times \frac{1}{3} & f & \quad \frac{1}{8} \times \frac{1}{8} & g & \quad \frac{1}{4} \times \frac{1}{4} & h & \quad \frac{3}{11} \times \frac{1}{11}
\end{align*}
\]

Evaluate the following, leaving your answers as mixed numbers where possible.

\[
\begin{align*}
a & \quad 1\frac{1}{2} \times \frac{1}{2} & b & \quad 1\frac{1}{4} \times 1\frac{1}{4} & c & \quad 2\frac{1}{2} \times 2\frac{1}{2} & d & \quad 1\frac{1}{2} \times 1\frac{1}{2} \\
e & \quad 3\frac{1}{2} \times 1\frac{1}{2} & f & \quad 1\frac{1}{4} \times 2\frac{1}{4} & g & \quad 2\frac{1}{2} \times 5 & h & \quad 4 \times 7\frac{1}{2}
\end{align*}
\]

A merchant buys 28 crates, each containing three-quarters of a tonne of waste metal. What is the total weight of this order?

A greedy girl eats one-quarter of a cake, and then half of what is left. How much cake is left uneaten?

Kathleen spent three-eighths of her income on rent, and two-fifths of what was left on food. What fraction of her income was left after buying her food?

Which is larger, \( \frac{2}{3} \) of \( 2\frac{1}{2} \) or \( \frac{1}{3} \) of \( 6\frac{1}{2} \)?

After James spent \( \frac{3}{5} \) of his pocket money on magazines, and \( \frac{1}{2} \) of his pocket money at a football match, he had £1.75 left. How much pocket money did he have in the beginning?

If £5.20 is two-thirds of three-quarters of a sum of money, what is the total amount of money?
### 2.4 Dividing by a fraction

This section will show you how to:

- divide by fractions

**Key word**

reciprocal

To divide by a fraction, we turn the fraction upside down (finding its reciprocal), and then multiply.

### Example 5

Work out

\( a \quad \frac{5}{8} \div \frac{3}{4} \quad b \quad 2\frac{1}{2} \div 3\frac{1}{3} \)

#### a

Rewrite as \( \frac{5}{8} \times \frac{4}{3} \).

\[
\frac{5}{8} \div \frac{3}{4} = \frac{5}{8} \times \frac{4}{3} = \frac{5 \times 4}{8 \times 3} = \frac{20}{24} = \frac{5}{6}
\]

#### b

First make the mixed numbers into top heavy fractions.

\[
2\frac{1}{2} - 3\frac{1}{3} = \frac{5}{2} - \frac{10}{3} = \frac{15}{6} - \frac{20}{6} = \frac{5}{6}
\]

### Exercise 2D

Evaluate the following, leaving your answers as mixed numbers where possible.

- a \( \frac{1}{3} \div \frac{1}{3} \)
- b \( \frac{3}{4} \div \frac{3}{4} \)
- c \( \frac{1}{2} \div \frac{1}{2} \)
- d \( \frac{3}{5} \div \frac{3}{5} \)
- e \( \frac{5}{11} \div \frac{1}{11} \)
- f \( \frac{6}{12} \div \frac{1}{12} \)
- g \( \frac{7}{12} \div \frac{1}{12} \)
- h \( \frac{3}{11} \div \frac{1}{11} \)
- i \( \frac{1}{16} \div \frac{3}{16} \)
- j \( \frac{3}{16} \div \frac{2}{16} \)

For a party, Zahar made twelve and a half litres of lemonade. His glasses could each hold five-sixteenths of a litre. How many of the glasses could he fill from the twelve and a half litres of lemonade?

How many strips of ribbon, each three and a half centimetres long, can I cut from a roll of ribbon that is fifty-two and a half centimetres long?

Joe’s stride is three-quarters of a metre long. How many strides does he take to walk along a bus twelve metres long?

Evaluate the following, leaving your answers as mixed numbers wherever possible.

- a \( \frac{2}{5} \times \frac{3}{10} \times \frac{1}{8} \)
- b \( \frac{3}{2} \times \frac{2}{3} \times 4 \)
- c \( \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \)
- d \( \frac{1}{8} \times \frac{1}{16} + 2\frac{1}{2} \)
- e \( (\frac{2}{3} \times \frac{1}{8}) \times (\frac{1}{2} \times \frac{1}{3}) \)
- f \( (\frac{1}{2} \times \frac{1}{3}) + (1\frac{1}{2} \times 1\frac{1}{4}) \)
Increase

There are two methods for increasing by a percentage.

Method 1
Find the increase and add it to the original amount.

EXAMPLE 6
Increase £6 by 5%.
Find 5% of £6: \( \frac{5}{100} \times 600p = 30p \). 5% of £6 = £0.30.
Add the £0.30 to the original amount: £6 + £0.30 = £6.30.

Method 2
Using a multiplier. An increase of 6% is equivalent to the original 100% plus the extra 6%. This is a total of 106% \( \left( \frac{106}{100} \right) \) and is equivalent to the multiplier 1.06.

EXAMPLE 7
Increase £6.80 by 5%.
A 5% increase is a multiplier of 1.05.
So £6.80 increased by 5% is £6.80 \times 1.05 = £7.14
What multiplier is equivalent to a percentage increase of each of the following?

- a) 10%
- b) 3%
- c) 20%
- d) 7%
- e) 12%

Increase each of the following by the given percentage. (Use any method you like.)

- a) £60 by 4%
- b) 12 kg by 8%
- c) 450 g by 5%
- d) 545 m by 10%
- e) £34 by 12%
- f) £75 by 20%
- g) 340 kg by 15%
- h) 670 cm by 23%
- i) 130 g by 95%
- j) £82 by 75%
- k) 640 m by 15%
- l) £28 by 8%

In 2000 the population of Melchester was 1,565,000. By 2005 that had increased by 8%. What was the population of Melchester in 2005?

A small firm made the same pay increase for all its employees: 5%.

a) Calculate the new pay of each employee listed below. Each of their salaries before the increase is given.

Bob, caretaker, £16,500  
Jean, supervisor, £19,500  
Anne, tea lady, £17,300  
Brian, manager, £25,300

b) Is the actual pay increase the same for each worker?

An advertisement for a breakfast cereal states that a special offer packet contains 15% more cereal for the same price than a normal 500 g packet. How much breakfast cereal is in a special offer packet?

At a school disco there are always about 20% more girls than boys. If at one disco there were 50 boys, how many girls were there?

VAT is a tax that the government adds to the price of most goods in shops. At the moment, it is 17.5% on all electrical equipment.

Calculate the price of the following electrical equipment after VAT of 17.5% has been added.

<table>
<thead>
<tr>
<th>Equipment</th>
<th>Pre-VAT price</th>
</tr>
</thead>
<tbody>
<tr>
<td>TV set</td>
<td>£245</td>
</tr>
<tr>
<td>Microwave oven</td>
<td>£72</td>
</tr>
<tr>
<td>CD player</td>
<td>£115</td>
</tr>
<tr>
<td>Personal stereo</td>
<td>£29.50</td>
</tr>
</tbody>
</table>

A hi-fi system was priced at £420 at the start of 2004. At the start of 2005, it was 12% more expensive. At the start of 2006, it was 15% more expensive than the price at the start of 2005. What is the price of the hi-fi at the start of 2006?

A quick way to work out VAT is to divide the pre-VAT price by 6. For example, the VAT on an item costing £120 is approximately £120 ÷ 6 = £20. Show that this approximate method gives the VAT correct to within £5 for pre-VAT prices up to £600.
Decrease

There are two methods for decreasing by a percentage.

**Method 1**
Find the decrease and take it away from the original amount.

**Method 2**
Using a multiplier. A 7% decrease is 7% less than the original 100%, so it represents 100% – 7% = 93% of the original. This is a multiplier of 0.93.

**EXAMPLE 8**
Decrease £8 by 4%.
Find 4% of £8: \( \frac{4}{100} \times 800p = 32p \). 4% of £8 = £0.32.
Take the £0.32 away from the original amount: £8 – £0.32 = £7.68.

**EXAMPLE 9**
Decrease £8.60 by 5%.
A decrease of 5% is a multiplier of 0.95.
So £8.60 decreased by 5% is £8.60 × 0.95 = £8.17

**EXERCISE 2F**

- What multiplier is equivalent to a percentage decrease of each of the following?
  - a 8%
  - b 15%
  - c 25%
  - d 9%
  - e 12%

- Decrease each of the following by the given percentage. (Use any method you like.)
  - a £10 by 6%
  - b 25 kg by 8%
  - c 236 g by 10%
  - d 350 m by 3%
  - e £5 by 2%
  - f 45 m by 12%
  - g 860 m by 15%
  - h 96 g by 13%
  - i 480 cm by 25%

- A car valued at £6500 last year is now worth 15% less. What is its value now?

- A large factory employed 640 people. It had to streamline its workforce and lose 30% of the workers. How big is the workforce now?

- On the last day of the Christmas term, a school expects to have an absence rate of 6%. If the school population is 750 pupils, how many pupils will the school expect to see on the last day of the Christmas term?
Since the start of the National Lottery a particular charity called Young Ones said it has seen a 45% decrease in the money raised from its scratch cards. If before the Lottery the charity had an annual income of £34 500 from its scratch cards, how much does it collect now?

Most speedometers in cars have an error of about 5% from the true reading. When my speedometer says I am driving at 70 mph,

a what is the slowest speed I could be doing,

b what is the fastest speed I could be doing?

You are a member of a club which allows you to claim a 12% discount off any marked price in shops. What will you pay in total for the following goods?

Sweatshirt £19
Tracksuit £26

I read an advertisement in my local newspaper last week which stated: “By lagging your roof and hot water system you will use 18% less fuel.” Since I was using an average of 640 units of gas a year, I thought I would lag my roof and my hot water system. How much gas would I expect to use now?

A computer system was priced at £1000 at the start of 2004. At the start of 2005, it was 10% cheaper. At the start of 2006, it was 15% cheaper than the price at the start of 2005. What is the price of the computer system at the start of 2006?

Show that a 10% decrease followed by a 10% increase is equivalent to a 1% decrease overall.

Expressing one quantity as a percentage of another

This section will show you how to:

- express one quantity as a percentage of another

Key words:

- percentage gain
- percentage loss

Method 1

We express one quantity as a percentage of another by setting up the first quantity as a fraction of the second, making sure that the units of each are the same. Then, we convert that fraction to a percentage by simply multiplying it by 100%.
We can use this method to calculate percentage gain or loss in a financial transaction.

**EXAMPLE 10**
Express £6 as a percentage of £40.
Set up the fraction and multiply it by 100%. This gives:
\[
\frac{6}{40} \times 100\% = 15\%
\]

**EXAMPLE 11**
Express 75 cm as a percentage of 2.5 m.
First, change 2.5 m to 250 cm to get a common unit.
Hence, the problem becomes 75 cm as a percentage of 250 cm.
Set up the fraction and multiply it by 100%. This gives
\[
\frac{75}{250} \times 100\% = 30\%
\]

**EXAMPLE 12**
Bert buys a car for £1500 and sells it for £1800. What is Bert’s percentage gain?
Bert’s gain is £300, so his percentage gain is
\[
\frac{300}{1500} \times 100\% = 20\%
\]
Notice how the percentage gain is found by
\[
\text{difference \over original} \times 100\%
\]

**EXAMPLE 13**
Express 5 as a percentage of 40.

\[
5 \div 40 = 0.125
\]
\[
0.125 = 12.5\%.
\]

Method 2
This method uses a multiplier. Divide the increase by the original quantity and change the resulting decimal to a percentage.
Express each of the following as a percentage. Give suitably rounded off figures where necessary.

a £5 of £20
b £4 of £6.60
c 241 kg of 520 kg
d 3 hours of 1 day
e 25 minutes of 1 hour
f 12 m of 20 m
g 125 g of 600 g
h 12 minutes of 2 hours
i 1 week of a year
j 1 month of 1 year
k 25 cm of 55 cm
l 105 g of 1 kg

John went to school with his pocket money of £2.50. He spent 80p at the tuck shop. What percentage of his pocket money had he spent?

In Greece, there are 3,654,000 acres of agricultural land. Olives are grown on 237,000 acres of this land. What percentage of agricultural land is used for olives?

During the wet year of 1981, it rained in Manchester on 123 days of the year. What percentage of days were wet?

Find, to one decimal place, the percentage profit on the following.

<table>
<thead>
<tr>
<th>Item</th>
<th>Retail price (selling price)</th>
<th>Wholesale price (price the shop paid)</th>
</tr>
</thead>
<tbody>
<tr>
<td>a CD player</td>
<td>£89.50</td>
<td>£60</td>
</tr>
<tr>
<td>b TV set</td>
<td>£345.50</td>
<td>£210</td>
</tr>
<tr>
<td>c Computer</td>
<td>£829.50</td>
<td>£750</td>
</tr>
</tbody>
</table>

Before Anton started to diet, he weighed 95 kg. He now weighs 78 kg. What percentage of his original weight has he lost?

In 2004 the Melchester County Council raised £14,870,000 in council tax. In 2005 it raised £15,970,000 in council tax. What was the percentage increase?

When Blackburn Rovers won the championship in 1995, they lost only four of their 42 league games. What percentage of games did they not lose?

In the year 1900 the value of Britain’s imports were as follows.

<table>
<thead>
<tr>
<th>Country</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>British Commonwealth</td>
<td>£109,530,000</td>
</tr>
<tr>
<td>USA</td>
<td>£138,790,000</td>
</tr>
<tr>
<td>France</td>
<td>£53,620,000</td>
</tr>
<tr>
<td>Other countries</td>
<td>£221,140,000</td>
</tr>
</tbody>
</table>

a What percentage of the total imports came from each source?
b Add up the answers to part a. Explain your answer.
Compound interest is calculated where the interest earned at the end of the first year is added to the principal (original amount), and the new total amount then earns further interest at the same annual rate in the following year. (Compound interest is usually used to calculate the interest on savings accounts.) This pattern is repeated year after year while the money is in the account. Therefore, the amount in the account grows bigger by the year, as does the actual amount of interest. The best way to calculate the total interest is to use a multiplier.

From this example, you can see that you could have used £400 \times (1.06)^3 to find the amount after 3 years. That is, you could have used the following formula for calculating the total amount due at any time:

\[
\text{total amount} = P \times \text{multiplier raised to the power } n = P \times (1 + x)^n
\]

where \( P \) is the original amount invested, \( x \) is the rate of interest expressed as a decimal, and \( n \) is the number of years for which the money is invested.

So, in Example 14, \( P = £400 \), \( x = 0.06 \), and \( n = 3 \),

and the total amount = £400 \times (1.06)^3
Using your calculator

You may have noticed that you can do the above calculation on your calculator without having to write down all the intermediate steps.

To add on the 6% each time just means multiplying by 1.06 each time. That is, you can do the calculation as

$$400 \times 1.06 \times 1.06 \times 1.06 =$$

Or

$$400 \times 1.06 \times 3 =$$

Or

$$400 \times 106\% \times 3 =$$

You need to find the method with which you are comfortable and which you understand.

The idea of compound interest does not only concern money. It can be about, for example, the growth in population, increases in salaries, or increases in body weight or height. Also the idea can involve regular reduction by a fixed percentage: for example, car depreciation, population losses and even water losses. Work through the next exercise and you will see the extent to which compound interest ideas are used.

**EXERCISE 2H**

A baby octopus increases its body weight by 5% each day for the first month of its life. In a safe ocean zoo, a baby octopus was born weighing 10 kg.

a What was its weight after

i 1 day?  
ii 2 days?  
iii 4 days?  
iv 1 week?

b After how many days will the octopus first weigh over 15 kg?

A certain type of conifer hedging increases in height by 17% each year for the first 20 years. When I bought some of this hedging, it was all about 50 cm tall. How long will it take to grow 3 m tall?

The manager of a small family business offered his staff an annual pay increase of 4% for every year they stayed with the firm.

a Gareth started work at the business on a salary of £12 200. What salary will he be on after 4 years?

b Julie started work at the business on a salary of £9350. How many years will it be until she is earning a salary of over £20 000?
Scientists have been studying the shores of Scotland and estimate that due to pollution the seal population of those shores will decline at the rate of 15% each year. In 2006 they counted around 3000 seals on those shores.

a If nothing is done about pollution, how many seals will they expect to be there in
   i 2007?  
   ii 2008?  
   iii 2011?

b How long will it take for the seal population to be less than 1000?

I am told that if I buy a new car its value will depreciate at the rate of 20% each year. I buy a car in 2006 priced at £8500. What would be the value of the car in

a 2007?  
b 2008?  
c 2010?

At the peak of the drought during the summer of 1995, a reservoir in Derbyshire was losing water at the rate of 8% each day. On 1 August this reservoir held 2.1 million litres of water.

a At this rate of losing water, how much would have been in the reservoir on the following days?
   i 2 August  
   ii 4 August  
   iii 8 August

b The danger point is when the water drops below 1 million litres. When would this have been if things had continued as they were?

The population of a small country, Yebon, was only 46 000 in 1990, but it steadily increased by about 13% each year during the 1990s.

a Calculate the population in
   i 1991  
   ii 1995  
   iii 1999.

b If the population keeps growing at this rate, when will it be half a million?

How long will it take to accumulate one million pounds in the following situations?

a An investment of £100 000 at a rate of 12% compound interest.

b An investment of £50 000 at a rate of 16% compound interest.

An oak tree is 60 cm tall. It grows at a rate of 8% per year. A conifer is 50 cm tall. It grows at a rate of 15% per year. How many years does it take before the conifer is taller than the oak?

A tree increases in height by 18% per year. When it is 1 year old, it is 8 cm tall. How long will it take the tree to grow to 10 m?

Show that a 10% increase followed by a 10% increase is equivalent to a 21% increase overall.
There are situations when we know a certain percentage and wish to get back to the original amount. There are two methods.

**Method 1**
The first method is the unitary method.

**EXAMPLE 15**
The 70 men who went on strike represented only 20% of the workforce. How large was the workforce?

Since 20% represents 70 people, then
1% will represent \(70 \div 20\) people [don’t work it out]
so 100% will represent \((70 \div 20) \times 100 = 350\)
Hence the workforce is 350.

**Method 2**
Using a multiplier.

**EXAMPLE 16**
The price of a refrigerator is decreased by 12% in a sale. The new price is £220. What was the original price before the reduction?

A decrease of 12% is a multiplier of 0.88.
Simply divide the new price by the multiplier to get the original price. \(220 \div 0.88 = 250\)
So the original price was £250.

**EXERCISE 2I**

Find what 100% represents in these situations.

- a 40% represents 320 g
- b 14% represents 35 m
- c 45% represents 27 cm
- d 4% represents £123
- e 2.5% represents £5
- f 8.5% represents £34

On a gruelling army training session, only 28 youngsters survived the whole day. This represented 35% of the original group. How large was the original group?

VAT is a government tax added to goods and services. With VAT at 17.5%, what is the pre-VAT price of the following priced goods?

<table>
<thead>
<tr>
<th>Item</th>
<th>Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>T shirt</td>
<td>£9.87</td>

<tr>
<td>Sweater</td>
<td>£12.62</td>
</tr>
<tr>
<td>Trainers</td>
<td>£29.14</td>
</tr>
<tr>
<td>Boots</td>
<td>£38.07</td>
</tr>
</tbody>
</table>

Howard spends £200 a month on food. This represents 24% of his monthly take-home pay. How much is his monthly take-home pay?

Tina’s weekly pay is increased by 5% to £315. What was Tina’s pay before the increase?

The number of workers in a factory fell by 5% to 228. How many workers were there originally?

In a sale a TV is reduced to a price of £325.50. This is a 7% reduction on the original price. What was the original price?

If 38% of plastic bottles in a production line are blue and the remaining 7750 plastic bottles are brown, how many plastic bottles are blue?

I received £3.85 back from the tax office, which represented the 17.5% VAT on a piece of equipment. How much did I pay for this equipment in the first place?

A man’s salary was increased by 5% in one year and reduced by 5% in the next year. Is his final salary greater or less than the original one and by how many per cent?

A quick way of estimating the pre-VAT price of an item with VAT added is to divide by 6 and then multiply by 5. For example, if an item is £360 including VAT, it is approximately (360 ÷ 6) × 5 = £300 before VAT. Show that this gives an estimate to within £5 of the pre-VAT price for items costing up to £280.
Mrs Senior earns £320 per week. She is awarded a pay rise of 4%. How much does she earn each week after the pay rise?

Five girls run a 100 metre race. Their times are shown in the table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Time (seconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amy</td>
<td>49.0</td>
</tr>
<tr>
<td>Bavna</td>
<td>45.5</td>
</tr>
<tr>
<td>Charlotte</td>
<td>51.3</td>
</tr>
<tr>
<td>Di</td>
<td>44.7</td>
</tr>
<tr>
<td>Ellie</td>
<td>48.1</td>
</tr>
</tbody>
</table>

a Write down the median time.
b The five girls run another 100 metre race. They all reduce their times by 10%.
i Calculate Amy’s new time.
ii Who won this race?
iii Who improved her time by the least amount of time?

Mr Shaw’s bill for new tyres is £120 plus VAT. VAT is charged at 17.5%. What is his total bill?

The table gives information about Year 10 and Year 11 at Mathstown School.

<table>
<thead>
<tr>
<th>Year</th>
<th>Number of girls</th>
<th>Number of boys</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>108</td>
<td>132</td>
</tr>
<tr>
<td>11</td>
<td>90</td>
<td>110</td>
</tr>
</tbody>
</table>

Mathstown School had an end of term party. 40% of the students in Year 10 and 70% of the students in Year 11 went to the party. Work out the percentage of all students in Years 10 and 11 who went to the party.

Mr and Mrs Jones are buying a tumble dryer that normally costs £250. They save 12% in a sale. How much do they pay for the tumble dryer?

Work out the value of \( \frac{3}{2} - \frac{3}{2} \)

On Friday James drinks \( \frac{1}{2} \) pints of fruit punch. On Saturday he drinks \( 2 \) pints of fruit punch. Work out the total amount of punch that James drinks on Friday and Saturday.

Andy uses \( \frac{3}{2} \) of a tin of creosote to creosote 2 m of fencing. What is the least number of tins he needs to creosote 10 m of fencing?

Pythagoras made a number of calculations trying to find an approximation for \( \pi \).

Here are a few of the closest approximations

\[ \frac{22}{7}, \frac{54}{17}, \frac{221}{71}, \frac{312}{101} \]

a Put these approximations into order of size, largest on the left, smallest on the right.
b Use your calculator to find which of the above is the closest approximation to \( \pi \).

These are 75 penguins at a zoo.
a There are 15 baby penguins. What percentage of the penguins are babies?
b The number of penguins increases by 40% each year. Calculate the number of penguins in the zoo after 2 years.

During 2003 the number of unemployed people in Barnsley fell from 2800 to 2576. What was the percentage decrease?

A painter has 50 litres of paint. Each litre covers 2.5 m\(^2\). The area to be painted is 98 m\(^2\). Estimate the percentage of paint used.

A garage sells cars. It offers a discount of 20% off the normal price for cash. Dave pays £5200 cash for a car. Calculate the normal price of the car.

Zoe invests £6000 in a savings account that pays 3.5% compound interest per year. How much does she have in the account after 6 years?

Work out \( 3\frac{1}{2} ÷ 4\frac{1}{2} \)

Leila’s savings account earns 10% per year compound interest.
a She invests £1500 in the savings account. How much will she have in her account after 2 years?
b Lewis has the same kind of account as his sister. After earning interest for one year, he has £358 in his account. How much money did Lewis invest?
WORKED EXAM QUESTION

a  Kelly bought a television set. After a reduction of 15% in a sale, the one she bought cost her £319.60. What was the original price of the television set?
b  A plant in a greenhouse is 10 cm high. It increases its height by 15% each day. How many days does it take to double in height?

Solution

a  £376.

\[ 10 \times 1.15^3 = 15.2 \]
\[ 10 \times 1.15^4 = 17.5 \]
\[ 10 \times 1.15^5 = 20.1 \]

Therefore, it takes 5 days to double in height.

b  A 15% reduction is a multiplier of 0.85. The original price will be the new price divided by the multiplier.

\[ 319.6 \div 0.85 = 376 \]

A 15% increase is a multiplier of 1.15. After \( n \) days the plant will be \( 10 \times 1.15^n \) high. Use trial and improvement to find the value that is over 20 cm.

\[ \text{Work out } \frac{\left( \frac{5}{2} + \frac{3}{5} \right)}{12} \]

Solution

\[ \frac{\frac{10}{12}}{12} \]
\[ 22 \times \frac{9}{15} \times \frac{18}{16} \]
\[ \frac{112}{512} \times \frac{9^3}{16^5} = \frac{33}{40} \]

First add the two fractions in the bracket by writing them with a common denominator, that is, \( \frac{10}{12} \times \frac{9}{12} \).

Make the mixed number into a top heavy fraction, \( \frac{10}{12} \), and turn it upside down and multiply.

Cancel out the common factors, and multiply numerators and denominators.
Mrs Woolman is a sheep farmer in Wales. When she sends her lambs to market, she keeps a record of how many lambs she sends, and the total live weight of these lambs in kilograms. Once they have been processed, she receives an information sheet showing the total weight of the meat from the lambs in kilograms, and the total price she has been paid for this meat.

For every week that she sends lambs to the market, she calculates the mean live weight of the lambs (to the nearest kilogram).

Copy the table below and complete the Mean live weight in kg column for her.

Mrs Woolman is happy with the condition of her lambs if the weight of the meat as a percentage of the live weight is over 42%. Complete the Meat as % of live weight column in your table. Indicate with a tick or a cross if she is happy with the condition of those lambs. Give percentages to one decimal place.

After Mrs Woolman has been paid for the meat, she calculates the price she is paid per kilogram of meat. Complete the final column, Price paid per kg of meat in your table. Give each price to the nearest penny.

<table>

Fractions and percentages

At the end of the season Mrs Woolman analyses the information she has calculated. Fill in the spaces in her notebook for her.

Mrs Woolman finds a line graph in a farming magazine showing the average lamb prices in England and Wales from April through to June. Copy this graph, and complete the line showing the price per kilogram that Mrs Woolman had for her lambs. Comment on these line graphs.

The mean weight per lamb has increased from ____ kg to ____ kg. This is an increase of ____%. However the price per kg of lamb has fallen from £____ to £____, a decrease of ____%. The only two weeks when the condition of the lambs fell below 42% were _______ and _______.

GRADE YOURSELF

- Able to add, subtract, multiply and divide fractions
- Able to calculate percentage increases and decreases
- Able to calculate with mixed numbers
- Able to work out compound interest problems
- Able to do reverse percentage problems
- Able to solve complex problems involving percentage increases and decreases

What you should know now

- How to calculate with fractions
- How to do percentage problems
This chapter will show you ...

- what a ratio is
- how to divide an amount into a given ratio
- how to solve problems involving direct proportion
- how to compare prices of products
- how to calculate speed
- how to calculate density

What you should already know

- Times tables up to $10 \times 10$
- How to cancel fractions
- How to find a fraction of a quantity
- How to multiply and divide, with and without a calculator

Quick check ➤ ANSWERS

1. Cancel down the following fractions.
   - $\frac{a}{b}$
   - $\frac{c}{d}$
   - $\frac{e}{f}$
   - $\frac{g}{h}$

2. Find the following quantities.
   - $\frac{a}{3}$ of £30
   - $\frac{b}{2}$ of £88
   - $\frac{c}{10}$ of 250 litres
   - $\frac{d}{3}$ of 24 kg
   - $\frac{e}{6}$ of 60 m
   - $\frac{f}{6}$ of £42
   - $\frac{g}{5}$ of 300 g
   - $\frac{h}{5}$ of 3.5 litres
A ratio is a way of comparing the sizes of two or more quantities.

A ratio can be expressed in a number of ways. For example, Joy is 5 years old and James is 20 years old. The ratio of their ages is Joy’s age : James’s age which is 5 : 20.

This simplifies to 1 : 4 (dividing both sides by 5).

A ratio can be expressed in words but it is usual to use a colon (:).

Joy’s age : James’s age or 5 : 20 or 1 : 4

Common units

When working with a ratio involving different units, always change them to a common unit. A ratio can be simplified only when the units of each quantity are the same, because the ratio itself doesn’t have any units.

For example, the ratio of 125 g to 2 kg must be changed to 125 g to 2000 g, so that we can simplify it to

\[
125 : 2000
\]

Divide both sides by 25

\[
5 : 80
\]

Divide both sides by 5

\[
1 : 16
\]

Ratios as fractions

A ratio in its simplest form can be expressed as portions by changing the whole numbers in the ratio into fractions with the same denominator (bottom number).

EXAMPLE 1

A garden is divided into lawn and shrubs in the ratio 3 : 2.

What fraction of the garden is covered by a lawn, b shrubs?

The denominator (bottom number) of the fraction comes from adding the numbers in the ratio (that is, 2 + 3 = 5).

a The lawn covers \(\frac{3}{5}\) of the garden.

b The shrubs cover \(\frac{2}{5}\) of the garden.
A length of wood is cut into two pieces in the ratio 3 : 7. What fraction of the original length is the longer piece?

Jack and Thomas find a bag of marbles which they divide between them in the ratio of their ages. Jack is 10 years old and Thomas is 15. What fraction of the marbles did Jack get?

Dave and Sue share a pizza in the ratio of 2 : 3. They eat it all.
- What fraction of the pizza did Dave eat?
- What fraction of the pizza did Sue eat?

A camp site allocates space to caravans and tents in the ratio 7 : 3. What fraction of the total space is given to:
- the caravans?
- the tents?

One morning a farmer notices that her hens, Gertrude, Gladys and Henrietta, have laid eggs in the ratio 2 : 3 : 4.
- What fraction of the eggs did Gertrude lay?
- What fraction of the eggs did Gladys lay?
- How many more eggs did Henrietta lay than Gertrude?

The recipe for a pudding is 125 g of sugar, 150 g of flour, 100 g of margarine and 175 g of fruit. What fraction of the pudding is each ingredient?

**Dividing amounts into given ratios**

To divide an amount into portions according to a given ratio, you first change the whole numbers in the ratio into fractions with the same common denominator. Then you multiply the amount by each fraction.

**EXAMPLE 2**

Divide £40 between Peter and Hitan in the ratio 2 : 3.

Changing the ratio to fractions gives:

Peter’s share = \( \frac{2}{2 + 3} = \frac{2}{5} \)

Hitan’s share = \( \frac{3}{2 + 3} = \frac{3}{5} \)

So, Peter receives £40 \( \times \frac{2}{5} = £16 \) and Hitan receives £40 \( \times \frac{3}{5} = £24 \).
EXAMPLE 3

Divide 63 cm in the ratio 3 : 4.

An alternative method that avoids fractions is to add the parts: 3 + 4 = 7.

Divide the original amount by the total: 63 ÷ 7 = 9.

Then multiply each portion of the original ratio by the answer: 3 × 9 = 27, 4 × 9 = 36.

So 63 cm in the ratio 3 : 4 is 27 cm : 36 cm.

Note that whichever method you use, you should always check that the final values add up to the original amount: £16 + £24 = £40 and 27 cm + 36 cm = 63 cm.

EXERCISE 3B

Divide the following amounts in the given ratios.

- a 400 g in the ratio 2 : 3
- b 280 kg in the ratio 2 : 5
- c 500 in the ratio 3 : 7
- d 1 km in the ratio 19 : 1
- e 5 hours in the ratio 7 : 5
- f £100 in the ratio 2 : 3 : 5
- g £240 in the ratio 3 : 5 : 12
- h 600 g in the ratio 1 : 5 : 6

The ratio of female to male members of Banner Cross Church is about 5 : 3. The total number of members of the church is 256.

- a How many members are female?
- b What percentage of members are male?

A supermarket tries to have in stock branded goods and its own goods in the ratio 2 : 5. It stocks 350 kg of breakfast cereal.

- a What percentage of the cereal stock is branded?
- b How much of the cereal stock is its own?

The Illinois Department of Health reported that, for the years 1981 to 1992, when it tested a total of 357 horses for rabies, the ratio of horses with rabies to those without was 1 : 16.

- a How many of these horses had rabies?
- b What percentage of the horses did not have rabies?

Being overweight increases the chances of an adult suffering from heart disease. The formulae below show a way to test whether an adult has an increased risk.

- W and H refer to waist and hip measurements.
- For women, increased risk when \( \frac{W}{H} > 0.8 \)
- For men, increased risk when \( \frac{W}{H} > 1.0 \)

Find whether the following people have an increased risk of heart disease or not.

Miss Mott: waist 26 inches, hips: 35 inches
Mrs Wright: waist 32 inches, hips: 37 inches
Mr Brennan: waist 32 inches, hips: 34 inches
Ms Smith: waist 31 inches, hips: 40 inches
Mr Kaye: waist 34 inches, hips: 33 inches

Rewrite the following scales as ratios, as simply as possible.

- **a** 1 cm to 4 km
- **b** 4 cm to 5 km
- **c** 2 cm to 5 km
- **d** 4 cm to 1 km
- **e** 5 cm to 1 km
- **f** 2.5 cm to 1 km

A map has a scale of 1 cm to 10 km.

- **a** Rewrite the scale as a ratio in its simplest form.
- **b** How long is a lake that is 4.7 cm on the map?
- **c** How long will an 8 km road be on the map?

A map has a scale of 2 cm to 5 km.

- **a** Rewrite the scale as a ratio in its simplest form.
- **b** How long is a path that measures 0.8 cm on the map?
- **c** How long should a 12 km road be on the map?

You can simplify a ratio by changing it into the form $1 : n$.

For example, $5 : 7$ can be rewritten as $\frac{5}{5} : \frac{7}{5} = 1 : 1.4$

Rewrite each of the following in the form $1 : n$.

- **a** 5 : 8
- **b** 4 : 13
- **c** 8 : 9
- **d** 25 : 36
- **e** 5 : 27
- **f** 12 : 18
- **g** 5 hours : 1 day
- **h** 4 hours : 1 week
- **i** £4 : £5

Calculating a ratio when only part of the information is known

**EXAMPLE 4**

Two business partners, John and Ben, divided their total profit in the ratio 3 : 5. John received £2100. How much did Ben get?

John’s £2100 was $\frac{3}{5}$ of the total profit. (Check you know why.)
So, $\frac{3}{5}$ of the total profit = £2100 ÷ 3 = £700
Therefore, Ben’s share, which was $\frac{2}{5}$ of the total, amounted to £700 × 5 = £3500.
Derek, aged 15, and Ricki, aged 10, shared, in the same ratio as their ages, all the conkers they found in the woods. Derek had 48 conkers.

a Simplify the ratio of their ages.

b How many conkers did Ricki have?

c How many conkers did they find altogether?

Two types of crisps, plain and salt'n vinegar, were bought for a school party in the ratio 5 : 3. They bought 60 packets of salt’n vinegar crisps.

a How many packets of plain crisps did they buy?

b How many packets of crisps did they buy altogether?

A blend of tea is made by mixing Lapsang with Assam in the ratio 3 : 5. I have a lot of Assam tea but only 600 g of Lapsang. How much Assam do I need to make the blend with all the Lapsang?

The ratio of male to female spectators at ice hockey games is 4 : 5. At the Steelers’ last match, 4500 men and boys watched the match. What was the total attendance at the game?

“Proper tea” is made by putting milk and tea together in the ratio 2 : 9. How much “proper tea” can be made by using 1 litre of milk?

A “good” children’s book is supposed to have pictures and text in the ratio 17 : 8. In a book I have just looked at, the pictures occupy 23 pages.

a Approximately how many pages of text should this book have to be deemed a “good” children’s book?

b What percentage of a “good” children’s book will be text?

Three business partners, Kevin, John and Margaret, put money into a venture in the ratio 3 : 4 : 5. They shared any profits in the same ratio. Last year, Margaret made £3400 out of the profits. How much did Kevin and John make last year?

Gwen is making a drink from lemonade, orange and ginger in the ratio 40 : 9 : 1. If Gwen has only 4.5 litres of orange, how much of the other two ingredients does she need to make the drink?

When I harvested my apples I found some had been eaten by wasps, some were just rotten and some were good ones. These were in the ratio 6 : 5 : 25. Eighteen of my apples had been eaten by wasps.

a What percentage of my apples were just rotten?

b How many good apples did I get?
The relationship between **speed**, **time** and **distance** can be expressed in three ways:

\[
\text{Speed} = \frac{\text{Distance}}{\text{Time}} \quad \text{Distance} = \text{Speed} \times \text{Time} \quad \text{Time} = \frac{\text{Distance}}{\text{Speed}}
\]

When we refer to speed, we usually mean **average speed**, as it is unusual to maintain one exact speed for the whole of a journey.

The relationships between distance \(D\), time \(T\) and speed \(S\) can be recalled using this diagram.

\[
D = S \times T \quad S = \frac{D}{T} \quad T = \frac{D}{S}
\]

**EXAMPLE 5**

Paula drove a distance of 270 miles in 5 hours. What was her average speed?

Paula’s average speed = \(\frac{\text{distance she drove}}{\text{time she took}}\) = \(\frac{270 \text{ miles}}{5 \text{ hours}}\) = 54 miles/h

**EXAMPLE 6**

Edith drove from Sheffield to Peebles for 3\(\frac{1}{2}\) hours at an average speed of 60 miles/h. How far is it from Sheffield to Peebles?

\[
\text{Distance} = \text{Speed} \times \text{Time}
\]

So, distance from Sheffield to Peebles is given by

\[
60 \text{ miles/h} \times 3.5 \text{ h} = 210 \text{ miles}
\]

**Note:** We changed the time to a decimal number and used 3.5, not 3.30!
Remember: When you calculate a time and get a decimal answer, as in Example 7, do not mistake the decimal part for minutes. You must either:
- leave the time as a decimal number and give the unit as hours, or
- change the decimal part to minutes by multiplying it by 60 (1 hour = 60 minutes) and give the answer in hours and minutes.

EXAMPLE 7

Sean is going to drive from Newcastle upon Tyne to Nottingham, a distance of 190 miles. He estimates that he will drive at an average speed of 50 miles/h. How long will it take him?

\[
\text{Sean’s time} = \frac{\text{distance he covers}}{\text{his average speed}} = \frac{190 \text{ miles}}{50 \text{ miles/h}} = 3.8 \text{ hours}
\]

Change the 0.8 hour to minutes by multiplying by 60, to give 48 minutes.
So, the time for Sean’s journey will be 3 hours 48 minutes.
(A sensible rounding off would give 4 hours or 3 hours 50 minutes.)

A train travels at 50 km/h for 2 hours, then slows down to do the last 30 minutes of its journey at 40 km/h.

a What is the total distance of this journey?
b What is the average speed of the train over the whole journey?
Jane runs and walks to work each day. She runs the first 2 miles at a speed of 8 mph and then walks the next mile at a steady 4 mph.

a How long does it take Jane to get to work?

b What is her average speed?

Colin drives home from his son's house in 2 hours 15 minutes. He says that he drives home at an average speed of 44 mph.

a Change the 2 hours 15 minutes to decimal time.

b How far is it from Colin's home to his son's house?

The distance between Paris and Le Mans is 200 km. The express train between Paris and Le Mans travels at an average speed of 160 km/h.

a Calculate the time taken for the journey from Paris to Le Mans, giving your answer in decimal hour notation.

b Change your answer to part a to hours and minutes.

The distance between Sheffield and Land's End is 420 miles.

a What is the average speed of a journey from Sheffield to Land's End if it takes 8 hours 45 minutes?

b If I covered the distance at an average speed of 63 mph, how long would it take me?

Change the following speeds to metres per second.

a 36 km/h  
b 12 km/h  
c 60 km/h  
d 150 km/h  
e 75 km/h

Change the following speeds to kilometres per hour.

a 25 m/s  
b 12 m/s  
c 4 m/s  
d 30 m/s  
e 0.5 m/s

A train travels at an average speed of 18 m/s.

a Express its average speed in km/h.

b Find the approximate time taken to travel 500 m.

c The train set off at 7:30 on a 40 km journey. At approximately what time will it arrive?
Suppose you buy 12 items which each cost the same. The total amount you spend is 12 times the cost of one item.

That is, the total cost is said to be in direct proportion to the number of items bought. The cost of a single item (the unit cost) is the constant factor that links the two quantities.

Direct proportion is concerned not only with costs. Any two related quantities can be in direct proportion to each other.

Finding the single unit value first is the best way to solve all problems involving direct proportion.

This method is called the unitary method, because it involves referring to a single unit value.

**Remember:** Before solving a direct proportion problem, think carefully about it to make sure that you know how to find the required single unit value.

---

**EXAMPLE 8**

If eight pens cost £2.64, what is the cost of five pens?

First, we need to find the cost of one pen. This is £2.64 ÷ 8 = £0.33.

So, the cost of five pens is £0.33 × 5 = £1.65.

---

**EXAMPLE 9**

Eight loaves of bread will make packed lunches for 18 people. How many packed lunches can be made from 20 loaves?

First, we need to find how many lunches one loaf will make.

One loaf will make 18 ÷ 8 = 2.25 lunches.

So, 20 loaves will make 2.25 × 20 = 45 lunches.
If 30 matches weigh 45 g, what would 40 matches weigh?

Five bars of chocolate cost £2.90. Find the cost of 9 bars.

Eight men can chop down 18 trees in a day. How many trees can 20 men chop down in a day?

Seventy maths textbooks cost £875.
   a  How much will 25 maths textbooks cost?
   b  How many maths textbooks can you buy for £100?

A lorry uses 80 litres of diesel fuel on a trip of 280 miles.
   a  How much would be used on a trip of 196 miles?
   b  How far would the lorry get on a full tank of 100 litres?

During the winter, I find that 200 kg of coal keeps my open fire burning for 12 weeks.
   a  If I want an open fire all through the winter (18 weeks), how much coal will I need to get?
   b  Last year I bought 150 kg of coal. For how many weeks did I have an open fire?

It takes a photocopier 16 seconds to produce 12 copies. How long will it take to produce 30 copies?

### 3.4 Best buys

This section will show you how to:
- find the cost per unit weight
- find the weight per unit cost
- find which product is the cheaper

Key word
best buy

When you wander around a supermarket and see all the different prices for the many different-sized packets, it is rarely obvious which are the best buys. However, with a calculator you can easily compare value for money by finding either:

the cost per unit weight  or  the weight per unit cost

To find:
- cost per unit weight, divide cost by weight
- weight per unit cost, divide weight by cost.

The next two examples show you how to do this.
Compare the following pairs of product and state which is the better buy, and why.

a. Coffee: a medium jar which is 140 g for £1.10 or a large jar which is 300 g for £2.18
b. Beans: a 125 g tin at 16p or a 600 g tin at 59p
c. Flour: a 3 kg bag at 75p or a 5 kg bag at £1.20
d. Toothpaste: a large tube which is 110 ml for £1.79 or a medium tube which is 75 ml for £1.15
e. Frosties: a large box which is 750 g for £1.64 or a medium box which is 500 g for £1.10
f. Rice Krispies: a medium box which is 440 g for £1.64 or a large box which is 600 g for £2.13
g. Hair shampoo: a bottle containing 400 ml for £1.15 or a bottle containing 550 ml for £1.60

Julie wants to respray her car with yellow paint. In the local automart, she sees the following tins:

- small tin: 350 ml at a cost of £1.79
- medium tin: 500 ml at a cost of £2.40
- large tin: 1.5 litres at a cost of £6.70

a. Which tin is offered at the cheapest cost per litre?
b. What is the cost per litre of paint in the small tin?

Tisco’s sells bottled water in three sizes.

- Handy size 40 cl: £0.38
- Family size 2 l: £0.98
- Giant size 5 l: £2.50

a. Work out the cost per litre of the ‘handy’ size.
b. Which bottle is the best value for money?
Two drivers are comparing the petrol consumption of their cars. Ahmed says, ‘I get 320 miles on a tank of 45 litres.’ Bashir says, ‘I get 230 miles on a tank of 32 litres.’ Whose car is the more economical?

Mary and Jane are arguing about which of them is better at mathematics. Mary scored 49 out of 80 on a test. Jane scored 60 out of 100 on a test of the same standard. Who is better at mathematics?

Paula and Kelly are comparing their running times. Paula completed a 10-mile run in 65 minutes. Kelly completed a 10-kilometre run in 40 minutes. Given that 8 kilometres are equal to 5 miles, which girl has the greater average speed?

Density is the mass of a substance per unit volume, usually expressed in grams per cm$^3$. The relationship between the three quantities is

\[
\text{Density} = \frac{\text{Mass}}{\text{Volume}}
\]

This is often remembered with a triangle similar to that for distance, speed and time.

\[
\begin{align*}
\text{Mass} &= \text{Density} \times \text{Volume} \\
\text{Density} &= \frac{\text{Mass}}{\text{Volume}} \\
\text{Volume} &= \frac{\text{Mass}}{\text{Density}}
\end{align*}
\]

**Note:** Density is defined in terms of mass, which is commonly referred to as weight, although, strictly speaking, there is a difference between them. (You may already have learnt about this in science.) In this book, the two terms are assumed to have the same meaning.
Find the density of a piece of wood weighing 6 g and having a volume of 8 cm$^3$.

Calculate the density of a metal if 12 cm$^3$ of it weighs 100 g.

Calculate the weight of a piece of plastic, 20 cm$^3$ in volume, if its density is 1.6 g/cm$^3$.

Calculate the volume of a piece of wood which weighs 102 g and has a density of 0.85 g/cm$^3$.

Find the weight of a marble model, 56 cm$^3$ in volume, if the density of marble is 2.8 g/cm$^3$.

Calculate the volume of a liquid weighing 4 kg and having a density of 1.25 g/cm$^3$.

Find the density of the material of a pebble which weighs 34 g and has a volume of 12.5 cm$^3$.

It is estimated that the statue of Queen Victoria in Endcliffe Park, Sheffield, has a volume of about 4 m$^3$. The density of the material used to make the statue is 9.2 g/cm$^3$. What is the estimated weight of the statue?

I bought a 50 kg bag of coal, and estimated the total volume of coal to be about 28 000 cm$^3$. What is the density of coal in g/cm$^3$?

A 1 kg bag of sugar has a volume of about 625 cm$^3$. What is the density of sugar in g/cm$^3$?
Three women earned a total of £36. They shared the £36 in the ratio 7 : 3 : 2.

Donna received the largest amount.

a Work out the amount Donna received.

A year ago, Donna weighed 51.5 kg. Donna now weighs 8\% less.

b Work out how much Donna now weighs. Give your answer to an appropriate degree of accuracy.

**Edexcel, Question 2, Paper 6 Higher, June 2005**

Bill and Ben buy £10 worth of lottery tickets. Ben pays £7 and Bill pays £3. They decide to share any prize in the ratio of the money they each paid.

a They win £350. How much does Bill get?

b What percentage of the £350 does Ben get?

**Edexcel, Question 5, Paper 6 Higher, November 2004**

Fred runs 200 metres in 21.2 seconds.

a Work out Fred’s average speed. Write down all the figures on your calculator display.

b Round off your answer to part a to an appropriate degree of accuracy.

**Edexcel, Question 6, Paper 6 Higher, November 2004**

To be on time, a train must complete a journey of 210 miles in 3 hours.

a Calculate the average speed of the train for the whole journey when it is on time.

b The train averages a speed of 56 mph over the first 98 miles of the journey. Calculate the average speed for the remainder of the journey so that the train arrives on time.

**WORKED EXAM QUESTION**

Solution

a 70 mph

b 98 ÷ 56 = 1.75 which is 1 hour and 45 minutes.

(210 – 98) ÷ (3 – 1.75) = 112 ÷ 1.25 = 89.6 mph

Average speed = distance ÷ time = 210 ÷ 3. Note that one question in the examination will ask you to state the units of your answer. This is often done with a speed question.

First find out how long the train took to do the first 98 miles.

Now work out the distance still to be travelled (112 miles) and the time left (1 hour 15 minutes = 1.25 hours). Divide distance by time to get the average speed.

GRADING YOURSELF

Calculate average speeds from data
Calculate distance from speed and time
Calculate time from speed and distance
Solve problems using ratio in appropriate situations
Solve problems involving density

What you should know now

● How to divide any amount into a given ratio
● The relationships between speed, time and distance
● How to do problems involving direct proportion
● How to compare the prices of products
● How to work out the density of materials
This chapter will show you ...

- how to calculate the length of an arc
- how to calculate the area of a sector
- how to find the area of a trapezium
- how to calculate the surface area and volume of prisms, cylinders, pyramids, cones and spheres

What you should already know

- The area of a rectangle is given by Area = length \times width or \( A = lw \)
- The area of a parallelogram is given by Area = base \times height or \( A = bh \)
- The area of a triangle is given by Area = \( \frac{1}{2} \times \) base \times height or \( A = \frac{1}{2}bh \)
- The circumference of a circle is given by \( C = \pi d \), where \( d \) is the diameter of the circle
- The area of a circle is given by \( A = \pi r^2 \), where \( r \) is the radius of the circle

continued
The most accurate value of $\pi$ that you can use is on your calculator. You should use it every time you have to work with $\pi$. Otherwise take $\pi$ to be 3.142.

In problems using $\pi$, unless told otherwise, round off your answers to three significant figures.

The volume of a cuboid is given by $V = l \times w \times h$.

The common metric units to measure area, volume and capacity are shown in this table.

<table>
<thead>
<tr>
<th>Area</th>
<th>Volume</th>
<th>Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 mm$^2$ = 1 cm$^2$</td>
<td>1000 mm$^3$ = 1 cm$^3$</td>
<td>1000 cm$^3$ = 1 litre</td>
</tr>
<tr>
<td>10 000 cm$^2$ = 1 m$^2$</td>
<td>1 000 000 cm$^3$ = 1 m$^3$</td>
<td>1 m$^3$ = 1000 litres</td>
</tr>
</tbody>
</table>

**Quick check**

1 Find the areas of the following shapes.

- **a**
  - 15 mm
  - 6 mm

- **b**
  - 8 cm
  - 5 cm

- **c**
  - 7 m
  - 6 m

2 Find the volume of this cuboid.

- 5 cm
- 3 cm
- 8 cm

If you need to revise circle calculations, you should work through Exercise 4A.
4.1 Circumference and area of a circle

In this section you will learn how to:
- calculate the circumference and area of a circle

Key words
- \(\pi\)
- area
- circumference

Example 1

Calculate the circumference of the circle. Give your answer to three significant figures.

\[
C = \pi d = \pi \times 5 \text{ cm} = 15.7 \text{ cm (to 3 significant figures)}
\]

Example 2

Calculate the area of the circle. Give your answer in terms of \(\pi\).

\[
A = \pi r^2 = \pi \times 6^2 \text{ m}^2 = 36\pi \text{ m}^2
\]

Exercise 4A

Copy and complete the following table for each circle. Give your answers to 3 significant figures.

<table>
<thead>
<tr>
<th></th>
<th>Radius</th>
<th>Diameter</th>
<th>Circumference</th>
<th>Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>4 cm</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b</td>
<td>2.6 m</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>c</td>
<td></td>
<td>12 cm</td>
<td></td>
<td></td>
</tr>
<tr>
<td>d</td>
<td></td>
<td>3.2 m</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Find the circumference of each of the following circles. Give your answers in terms of \(\pi\).

- a: Diameter 5 cm  
- b: Radius 4 cm  
- c: Radius 9 m  
- d: Diameter 12 cm

Find the area of each of the following circles. Give your answers in terms of \(\pi\).

- a: Radius 5 cm  
- b: Diameter 12 cm  
- c: Radius 10 cm  
- d: Diameter 1 m
A rope is wrapped eight times round a capstan (a cylindrical post), the diameter of which is 35 cm. How long is the rope?

The roller used on a cricket pitch has a radius of 70 cm.

a What is the circumference of the roller?

b A cricket pitch has a length of 20 m. How many complete revolutions does the roller make when rolling the pitch?

The diameter of each of the following coins is as follows.

1p: 2 cm, 2p: 2.6 cm, 5p: 1.7 cm, 10p: 2.4 cm

Calculate the area of one face of each coin. Give your answers to 1 decimal place.

A circle has a circumference of 25 cm. What is its diameter?

What is the total perimeter of a semicircle of diameter 15 cm?

What is the total perimeter of a semicircle of radius 7 cm? Give your answer in terms of $\pi$.

Calculate the area of each of these shapes, giving your answers in terms of $\pi$.

Calculate the area of the shaded part of each of these diagrams, giving your answers in terms of $\pi$.

Assume that the human waist is circular.

a What are the distances around the waists of the following people?

Sue: waist radius of 10 cm
Dave: waist radius of 12 cm
Julie: waist radius of 11 cm
Brian: waist radius of 13 cm

b Compare differences between pairs of waist circumferences. What connection do they have to $\pi$?

c What would be the difference in length between a rope stretched tightly round the Earth and another rope always held 1 m above it?
4.2 Area of a trapezium

In this section you will learn how to:
- find the area of a trapezium

Key word: trapezium

The area of a trapezium is calculated by finding the average of the lengths of its parallel sides and multiplying this by the perpendicular distance between them.

\[ A = \frac{1}{2} (a + b)h \]

**EXAMPLE 3**

Find the area of the trapezium ABCD.

\[ A = \frac{1}{2}(4 + 7) \times 3 \text{ cm}^2 \]
\[ = 16.5 \text{ cm}^2 \]

**EXERCISE 4B**

Copy and complete the following table for each trapezium.

<table>
<thead>
<tr>
<th></th>
<th>Parallel side 1</th>
<th>Parallel side 2</th>
<th>Vertical height</th>
<th>Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>8 cm</td>
<td>4 cm</td>
<td>5 cm</td>
<td></td>
</tr>
<tr>
<td>b</td>
<td>10 cm</td>
<td>12 cm</td>
<td>7 cm</td>
<td></td>
</tr>
<tr>
<td>c</td>
<td>7 cm</td>
<td>5 cm</td>
<td>4 cm</td>
<td></td>
</tr>
<tr>
<td>d</td>
<td>5 cm</td>
<td>9 cm</td>
<td>6 cm</td>
<td></td>
</tr>
<tr>
<td>e</td>
<td>3 m</td>
<td>13 m</td>
<td>5 m</td>
<td></td>
</tr>
<tr>
<td>f</td>
<td>4 cm</td>
<td>10 cm</td>
<td>42 cm²</td>
<td></td>
</tr>
<tr>
<td>g</td>
<td>7 cm</td>
<td>8 cm</td>
<td>22.5 cm²</td>
<td></td>
</tr>
<tr>
<td>h</td>
<td>6 cm</td>
<td>5 cm</td>
<td>40 cm²</td>
<td></td>
</tr>
</tbody>
</table>

Calculate the perimeter and the area of each of these trapeziums.
Calculate the area of each of these compound shapes.

Calculate the area of the shaded part in each of these diagrams.

A trapezium has an area of 25 cm$^2$. Its vertical height is 5 cm. Write down five different possible pairs of lengths which the two parallel sides could be.

What percentage of this shape has been shaded?

The shape of most of Egypt (see map) roughly approximates to a trapezium. The north coast is about 900 km long, the south boundary is about 1100 km long, and the distance from north to south is about 1100 km.

What is the approximate area of this part of Egypt?

A trapezium has parallel sides of $a$ and $b$ with a perpendicular height $h$. The trapezium is rotated by 180° and two trapezia are put together as shown.

Use the diagram to prove that the area of a trapezium is $\frac{1}{2}h(a + b)$.
A **sector** is part of a circle, bounded by two radii of the circle and one of the **arcs** formed by the intersection of these radii with the circumference.

The angle subtended at the centre of the circle by the arc of a sector is known as the angle of the sector.

When a circle is divided into only two sectors, the larger one is called the major sector and the smaller one is called the minor sector.

Likewise, their arcs are called respectively the major arc and the minor arc.

### Length of an arc and area of a sector

A sector is a fraction of the whole circle, the size of the fraction being determined by the size of angle of the sector. The angle is often written as \( \theta \), a Greek letter pronounced *theta*. For example, the sector shown in the diagram represents the fraction \( \frac{\theta}{360^\circ} \).

This applies to both its arc length and its area. Therefore,

\[
\text{Arc length} = \frac{\theta^\circ}{360^\circ} \times 2\pi r \quad \text{or} \quad \frac{\theta^\circ}{360^\circ} \times \pi d
\]

\[
\text{Sector area} = \frac{\theta^\circ}{360^\circ} \times \pi r^2
\]

#### Example 4

Find the arc length and the area of the sector in the diagram.

The sector angle is 28° and the radius is 5 cm. Therefore,

\[
\text{Arc length} = \frac{28^\circ}{360^\circ} \times \pi \times 2 \times 5 = 2.4 \text{ cm (1 decimal place)}
\]

\[
\text{Sector area} = \frac{28^\circ}{360^\circ} \times \pi \times 5^2 = 6.1 \text{ cm}^2 \text{ (1 decimal place)}
\]
For each of these sectors, calculate i the arc length ii the sector area

2 Calculate the arc length and the area of a sector whose arc subtends an angle of 60° at the centre of a circle with a diameter of 12 cm. Give your answer in terms of π.

3 Calculate the total perimeter of each of these sectors.

4 Calculate the area of each of these sectors.

5 Calculate the area of the shaded shape giving your answer in terms of π.

6 ABCD is a square of side length 8 cm. APC and AQC are arcs of the circles with centres D and B. Calculate the area of the shaded part.

7 A pendulum of length 72 cm swings through an angle of 15°. Through what distance does the bob swing? Give your answer in terms of π.

8 Find i the perimeter and ii the area of this shape.
4.4 Volume of a prism

In this section you will learn how to:
● calculate the volume of a prism

Key words
cross-section
prism

A prism is a 3-D shape which has the same cross-section running all the way through it.

The volume of a prism is found by multiplying the area of its cross-section by the length of the prism (or height if the prism is stood on end).

That is, Volume of prism = area of cross-section \times \text{length} \quad \text{or} \quad V = Al

EXAMPLE 5

Find the volume of the triangular prism.

The area of the triangular cross-section = A = \frac{5 \times 7}{2} = 17.5 \text{ cm}^2

The volume is the area of its cross-section \times \text{length} = Al
= 17.5 \times 9 = 157.5 \text{ cm}^3
For each prism shown

i sketch the cross-section

ii calculate the area of the cross-section

iii calculate the volume.

Calculate the volume of each of these prisms.

The uniform cross-section of a swimming pool is a trapezium with parallel sides, 1 m and 2.5 m, with a perpendicular distance of 30 m between them. The width of the pool is 10 m. How much water is in the pool when it is full? Give your answer in litres.

A lean-to is a prism. Calculate the volume of air inside the lean-to with the dimensions shown in the diagram. Give your answer in litres.

Each of these prisms has a regular cross-section in the shape of a right-angled triangle.

a Find the volume of each prism.

b Find the total surface area of each prism.
The top and bottom of the container shown here are the same size, both consisting of a rectangle, 4 cm by 9 cm, with a semicircle at each end. The depth is 3 cm. Find the volume of the container.

A tunnel is in the shape of a semicircle of radius 5 m, running for 500 m through a hill. Calculate the volume of soil removed when the tunnel was cut through the hill.

A horse trough is in the shape of a semicircular prism as shown. What volume of water will the trough hold when it is filled to the top? Give your answer in litres.

The dimensions of the cross-section of a girder, 2 m in length, are shown on the diagram. The girder is made of iron with a density of 7.9 g/cm³. What is the mass of the girder?

Since a cylinder is an example of a prism, its volume is found by multiplying the area of one of its circular ends by the height.

That is, \( \text{Volume} = \pi r^2 h \)

where \( r \) is the radius of the cylinder and \( h \) is its height or length.

\[ \text{Volume} = \pi \times 5^2 \times 12 \text{ cm}^3 = 942 \text{ cm}^3 \] (3 significant figures)
**Surface area**

The total surface area of a cylinder is made up of the area of its curved surface plus the area of its two circular ends.

The curved surface area, when opened out, is a rectangle whose length is the circumference of the circular end.

\[
\text{Curved surface area} = \text{circumference of end} \times \text{height of cylinder} = 2\pi rh \text{ or } \pi dh
\]

Area of one end = \(\pi r^2\)

Therefore, total surface area = \(2\pi rh + 2\pi r^2\) or \(\pi dh + 2\pi r^2\)

**EXAMPLE 7**

What is the total surface area of a cylinder with a radius of 15 cm and a height of 2.5 m?

First, you must change the dimensions to a common unit. Use centimetres in this case.

Total surface area = \(\pi dh + 2\pi r^2\)

\[
= \pi \times 30 \times 250 + 2 \times \pi \times 15^2 \text{ cm}^2
\]

\[
= 23562 + 1414 \text{ cm}^2
\]

\[
= 24976 \text{ cm}^2
\]

\[
= 25000 \text{ cm}^2 \text{ (3 significant figures)}
\]

**EXERCISE 4E**

Find i the volume and ii the total surface area of each of these cylinders. Give your answers to 3 significant figures.

1. a base radius 3 cm and height 8 cm
2. b base diameter 8 cm and height 7 cm
3. c base diameter 12 cm and height 5 cm
4. d base radius of 10 m and length 6 m

The diameter of a marble, cylindrical column is 60 cm and its height is 4.2 m. The cost of making this column is quoted as £67.50 per cubic metre. What is the estimated total cost of making the column?

Find the mass of a solid iron cylinder 55 cm high with a base diameter of 60 cm. The density of iron is 7.9 g/cm³.
4.6 Volume of a pyramid

In this section you will learn how to:

- calculate the volume of a pyramid

Key words

apex  
frustum  
pyramid  
volume

A pyramid is a 3-D shape with a base from which triangular faces rise to a common vertex, called the apex. The base can be any polygon, but is usually a triangle, a rectangle or a square.

The volume of a pyramid is given by

\[
V = \frac{1}{3}Ah
\]

where \(A\) is the base area and \(h\) is the vertical height.

**EXAMPLE 8**

Calculate the volume of the pyramid on the right.

Base area = \(5 \times 4 = 20\) cm\(^2\)

Volume = \(\frac{1}{3} \times 20 \times 6 = 40\) cm\(^3\)
EXAMPLE 9

A pyramid, with a square base of side 8 cm, has a volume of 320 cm$^3$. What is the vertical height of the pyramid?

Let $h$ be the vertical height of the pyramid. Then,

$\text{Volume} = \frac{1}{3} \times 64 \times h = 320 \text{ cm}^3$

$\frac{64h}{3} = 320 \text{ cm}^3$

$h = \frac{960}{64} \text{ cm}$

$h = 15 \text{ cm}$

EXERCISE 4F

1. Calculate the volume of each of these pyramids, all with rectangular bases.

   a. ![Pyramid a]
   b. ![Pyramid b]
   c. ![Pyramid c]
   d. ![Pyramid d]
   e. ![Pyramid e]

2. Calculate the volume of a pyramid having a square base of side 9 cm and a vertical height of 10 cm.

3. Calculate the volume of each of these shapes.

   a. ![Shape a]
   b. ![Shape b]
   c. ![Shape c]
4. What is the mass of a solid pyramid having a square base of side 4 cm, a height of 3 cm and a density of 13 g/cm³?

5. A crystal is in the form of two square-based pyramids joined at their bases (see diagram). The crystal has a mass of 31.5 grams. What is its density?

6. Find the mass of each of these pyramids.

   ![Pyramids](image)

   a. Density 2.7 g/cm³
   b. Density 3.5 g/cm³
   c. Density 2.1 g/cm³

7. Calculate the length x in each of these rectangular-based pyramids.

   ![Pyramids](image)

   a. Weight 828 g, Density 2.3 g/cm³
   b. Weight 180 g, Density 4.5 g/cm³

8. The pyramid in the diagram has its top 5 cm cut off as shown. The shape which is left is called a frustum. Calculate the volume of the frustum.
A cone can be treated as a pyramid with a circular base. Therefore, the formula for the volume of a cone is the same as that for a pyramid.

\[
V = \frac{1}{3} \times \text{base area} \times \text{vertical height}
\]

where \( r \) is the radius of the base and \( h \) is the vertical height of the cone.

The curved surface area of a cone is given by

\[
S = \pi rl
\]

where \( l \) is the slant height of the cone.

So the total surface area of a cone is given by the curved surface area plus the area of its circular base.

\[
A = \pi rl + \pi r^2
\]

**EXAMPLE 10**

For the cone in the diagram, calculate

i) its volume and

ii) its total surface area.

Give your answers in terms of \( \pi \).

i) The volume is given by

\[
V = \frac{1}{3} \pi r^2 h
\]

\[
= \frac{1}{3} \times \pi \times 36 \times 8 = 96\pi \text{ cm}^3
\]

ii) The total surface area is given by

\[
A = \pi rl + \pi r^2
\]

\[
= \pi \times 6 \times 10 + \pi \times 36 = 96\pi \text{ cm}^2
\]
For each cone, calculate (i) its volume and (ii) its total surface area. Give your answers to 3 significant figures.

A solid cone, base radius 6 cm and vertical height 8 cm, is made of metal whose density is 3.1 g/cm³. Find the mass of the cone.

Find the total surface area of a cone whose base radius is 3 cm and slant height is 5 cm. Give your answer in terms of \( \pi \).

Find the total surface area of a cone whose base radius is 5 cm and slant height is 13 cm.

Calculate the volume of each of these shapes. Give your answers in terms of \( \pi \).

The model shown on the right is made from aluminium. What is the mass of the model, given that the density of aluminium is 2.7 g/cm³?

A container in the shape of a cone, base radius 10 cm and vertical height 19 cm, is full of water. The water is poured into an empty cylinder of radius 15 cm. How high is the water in the cylinder?
The volume of a sphere, radius \( r \), is given by
\[ V = \frac{4}{3} \pi r^3 \]

Its surface area is given by
\[ A = 4\pi r^2 \]

**EXAMPLE 11**

For a sphere of radius of 8 cm, calculate i its volume and ii its surface area.

i The volume is given by
\[ V = \frac{4}{3} \pi r^3 = \frac{4}{3} \times \pi \times 8^3 = \frac{2048}{3} \times \pi = 2140 \text{ cm}^3 \ (3 \text{ significant figures}) \]

ii The surface area is given by
\[ A = 4\pi r^2 = 4 \times \pi \times 8^2 = 256 \times \pi = 804 \text{ cm}^2 \ (3 \text{ significant figures}) \]

**EXERCISE 4H**

1. Calculate the volume of each of these spheres. Give your answers in terms of \( \pi \).
   - a Radius 3 cm
   - b Radius 6 cm
   - c Diameter 20 cm

2. Calculate the surface area of each of these spheres. Give your answers in terms of \( \pi \).
   - a Radius 3 cm
   - b Radius 5 cm
   - c Diameter 14 cm

3. Calculate the volume and the surface area of a sphere with a diameter of 50 cm.

4. A sphere fits exactly into an open cubical box of side 25 cm. Calculate the following.
   - a the surface area of the sphere
   - b the volume of the sphere

5. A metal sphere of radius 15 cm is melted down and recast into a solid cylinder of radius 6 cm. Calculate the height of the cylinder.

6. Lead has a density of 11.35 g/cm³. Calculate the maximum number of shot (spherical lead pellets) of radius 1.5 mm which can be made from 1 kg of lead.

7. Calculate, correct to one decimal place, the radius of a sphere
   - a whose surface area is 150 cm²
   - b whose volume is 150 cm³.
The diagram shows a triangular prism.

a Work out the total surface area of the prism.

b Work out the volume of the prism.

A semi-circular protractor has a diameter of 10 cm. Calculate its perimeter. Give your answer in terms of \( \pi \).

A solid cylinder has a radius of 6 cm and a height of 20 cm.

a Calculate the volume of the cylinder. Give your answer correct to 3 significant figures.

b Calculate the mass of the cylinder. Give your answer correct to 3 significant figures.

Edexcel, Question 1, Paper 13B Higher, March 2005

OAB is a minor sector of a circle of radius 8 cm.

Angle AOB = 120°

Calculate the area of the minor sector OAB. Give your answer to 1 decimal place.

Edexcel, Question 1, Paper 13B Higher, March 2005

The diagram shows a litter bin. The bin consists of a cylinder and a hemisphere. The cylinder has a diameter of 40 cm and a height of 60 cm.

Calculate the volume of the litter bin. Give your answer to 3 significant figures.

Solution

Volume of litter bin

\[ \pi r^2h + \frac{2}{3} \pi r^3 \]

(The volume of a sphere is \( \frac{4}{3} \pi r^3 \) so the volume of a hemisphere is half this.)

\[ \pi \times 20^2 \times 60 + \frac{2}{3} \times \pi \times 20^3 \]

Use the \( \pi \) button on your calculator.

\[ = 92200 \text{ cm}^3 \text{ (to 3 sf)} \]
Mr and Mrs Jones have decided to “go green”. They want to install a water purifying unit and water tank in their loft to collect rain water from their roof, and use this water for the washing machine, dishwasher, shower and toilet.

Copy the table below and help them to calculate their average total daily water usage for these four items.

<table>
<thead>
<tr>
<th>BATHROOM</th>
<th>The toilet cistern has a cross section that is a trapezium. The diagram shows the amount of water that is used in one flush of the toilet.</th>
</tr>
</thead>
</table>

**Daily water usage**

<table>
<thead>
<tr>
<th></th>
<th>litres used each: flush/shower/load</th>
<th>frequency used</th>
<th>total litres per day</th>
</tr>
</thead>
<tbody>
<tr>
<td>Toilet</td>
<td>12 times a day</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Shower</td>
<td>2 times a day</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Washing machine</td>
<td>3 times a week</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Dishwasher</td>
<td>once every 2 days</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>TOTAL:</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The shower uses 2.5 gallons per minute. An average shower takes 8 minutes.
They consider installing this cylindrical tank in their loft for the rainwater. They know on average how much water they use and collect in one day. If they don’t start to use the tank until it is full, and assuming there is average rainfall, estimate how many days it will be before they can use the tank.

A gutter around the roof collects all the rainwater. The average daily rainfall is 2 mm per square metre of roof. On average, how much rainwater could they collect in one day?

This is a diagram showing the dimensions of their roof.

1 gallon is approximately 4.55 litres.

KITCHEN
The dishwasher uses 9 gallons per load.

KITCHEN
The washing machine uses 25 gallons per load.

SUMMARY

GRADE YOURSELF

- Able to calculate the circumference and area of a circle
- Able to calculate the area of a trapezium
- Able to calculate the volume of prisms and cylinders
- Able to calculate the length of an arc and the area of a sector
- Able to calculate the surface area of cylinders, cones and spheres
- Able to calculate the volume of pyramids, cones and spheres
- Able to calculate volume and surface area of compound 3-D shapes

What you should know now

- For a sector of radius \( r \) and angle \( \theta \)
  
  \[
  \text{Arc length} = \frac{\theta^\circ}{360^\circ} \times 2\pi r \quad \text{or} \quad \frac{\theta^\circ}{360^\circ} \times \pi d
  \]
  
  \[
  \text{Area of a sector} = \frac{\theta^\circ}{360^\circ} \times \pi r^2
  \]

- The area of a trapezium is given by
  
  \[
  A = \frac{1}{2}(a + b)h
  \]
  
  where \( h \) is the vertical height, and \( a \) and \( b \) are the lengths of the two parallel sides

- The volume of a prism is given by \( V = Al \), where \( A \) is the cross-section area and \( l \) is the length of the prism

- The volume of a cylinder is given by \( V = \pi r^2 h \) where \( r \) is the radius and \( h \) is the height or length of the cylinder

- The curved surface area of a cylinder is given by \( S = 2\pi rh \), where \( r \) is the radius and \( h \) is the height or length of the cylinder

- The volume of a pyramid is given by \( V = \frac{1}{3}Ah \), where \( A \) is the area of the base and \( h \) is the vertical height of the pyramid

- The volume of a cone is given by \( V = \frac{1}{3}\pi r^2 h \) where \( r \) is the base radius and \( h \) is the vertical height of the cone

- The curved surface area of a cone is given by \( S = \pi rl \), where \( r \) is the base radius and \( l \) is the slant height of the cone

- The volume of a sphere is given by \( V = \frac{4}{3}\pi r^3 \) where \( r \) is its radius

- The surface area of a sphere is given by \( A = 4\pi r^2 \) where \( r \) is its radius
This chapter will show you ...

- how to manipulate basic algebraic expressions by multiplying terms together, expanding brackets and collecting like terms
- how to factorise linear expressions
- how to solve linear equations
- how to solve simultaneous equations
- how to rearrange formulae

What you should already know

- The basic language of algebra
- How to collect together like terms
- How to multiply together terms such as $2m \times 3m$

Quick check

1. Expand the following.
   a. $2(s + 6)$
   b. $4(s - 3)$
   c. $6(2x - 1)$

2. Simplify the following.
   a. $4y + 2y - y$
   b. $3x + 2 + x - 5$
   c. $2(x + 1) - 3(x + 2)$

3. Simplify the following.
   a. $3 \times 2y$
   b. $4y \times 2y$
   c. $c^2 \times 2c$

4. Solve the following equations.
   a. $2x + 4 = 6$
   b. $3x - 5 = 4$
   c. $\frac{x}{3} + 2 = 5$
   d. $\frac{x}{2} = 4$
   e. $\frac{x}{3} = 8$
   f. $\frac{2x}{5} = 6$
Substitution

**EXAMPLE 1**

Find the value of $3x^2 - 5$ when $a \ x = 3$, $b \ x = -4$.

Whenever you substitute a number for a variable in an expression always put the value in a bracket before working it out. This will avoid errors in calculation, especially with negative numbers.

a When $x = 3$, $3(3)^2 - 5 = 3 \times 9 - 5 = 27 - 5 = 22$

b When $x = -4$, $3(-4)^2 - 5 = 3 \times 16 - 5 = 48 - 5 = 43$

**EXAMPLE 2**

Find the value of $L = a^2 - 8b^2$ when $a = -6$ and $b = \frac{1}{2}$.

Substitute for the letters.

$L = (-6)^2 - 8(\frac{1}{2})^2$

$L = 36 - 8 \times \frac{1}{4} = 36 - 2 = 34$

Note: if you do not use brackets and write $-6^2$, this could be wrongly evaluated as $-36$.

**EXERCISE 5A**

1. Find the value of $4b + 3$ when $a \ b = 2.5$, $b \ b = -1.5$, $c \ b = \frac{1}{2}$.

2. Evaluate $\frac{x}{3}$ when $a \ x = 6$, $b \ x = 24$, $c \ x = -30$.

3. Find the value of $\frac{12}{y}$ when $a \ y = 2$, $b \ y = 4$, $c \ y = -6$.

4. Evaluate $3w - 4$ when $a \ w = -1$, $b \ w = -2$, $c \ w = 3.5$.

5. Find the value of $\frac{24}{x}$ when $a \ x = -5$, $b \ x = \frac{1}{2}$, $c \ x = \frac{1}{4}$. 
Where \( P = \frac{5w - 4y}{w + y} \), find \( P \) when

- \( a \): \( w = 3 \) and \( y = 2 \),
- \( b \): \( w = 6 \) and \( y = 4 \),
- \( c \): \( w = 2 \) and \( y = 3 \).

Where \( A = b^2 + c^2 \), find \( A \) when

- \( a \): \( b = 2 \) and \( c = 3 \),
- \( b \): \( b = 5 \) and \( c = 7 \),
- \( c \): \( b = -1 \) and \( c = -4 \).

Where \( A = \frac{180(a - 2)}{n + 5} \), find \( A \) when

- \( a \): \( n = ! \),
- \( b \): \( n = 3 \),
- \( c \): \( n = -1 \).

Where \( Z = \frac{y^2 + 4}{4 + y} \), find \( Z \) when

- \( a \): \( y = 4 \),
- \( b \): \( y = -6 \),
- \( c \): \( y = -1.5 \).

Expansion

In mathematics, the term “expand” usually means “multiply out”. For example, expressions such as \( 3(y + 2) \) and \( 4y^2(2y + 3) \) can be expanded by multiplying out.

You need to remember that there is an invisible multiplication sign between the outside number and the bracket. So that \( 3(y + 2) \) is really \( 3 \times (y + 2) \), and \( 4y^2(2y + 3) \) is really \( 4y^2 \times (2y + 3) \).

We expand by multiplying everything inside the bracket by what is outside the bracket.

So in the case of the two examples above,

\[
3(y + 2) = 3 \times (y + 2) = 3 \times y + 3 \times 2 = 3y + 6
\]
\[
4y^2(2y + 3) = 4y^2 \times (2y + 3) = 4y^2 \times 2y + 4y^2 \times 3 = 8y^3 + 12y^2
\]

Look at these next examples of expansion, which show clearly how the term outside the bracket has been multiplied with the terms inside it.

\[
2(m + 3) = 2m + 6
\]
\[
y(y^2 - 4x) = y^3 - 4xy
\]
\[
3(2t + 5) = 6t + 15
\]
\[
3x^2(4x + 5) = 12x^3 + 15x^2
\]
\[
m(p + 7) = mp + 7m
\]
\[
-3(2 + 3x) = -6 - 9x
\]
\[
x(x - 6) = x^2 - 6x
\]
\[
-2x(3 - 4x) = -6x + 8x^2
\]
\[
4t^3 + 2 = 4t^4 + 8t
\]
\[
3t(2 + 5t - p) = 6t + 15t^2 - 3pt
\]

Note: the signs change when a negative quantity is outside the bracket. For example,

\[
a(b + c) = ab + ac
\]
\[
a(b - c) = ab - ac
\]
\[
-a(b + c) = -ab - ac
\]
\[
-a(b - c) = -ab + ac
\]
\[
-(a - b) = -a + b
\]
\[
-(a + b - c) = -a - b + c
\]
Expand these expressions.

1. \(2(3 + m)\)
2. \(3(2 - 4f)\)
3. \(t(t + 3)\)
4. \(4g(2g + 5)\)
5. \(k(k^2 - 5)\)
6. \(5a(3a^2 - 2b)\)

7. \(5(2 + l)\)
8. \(2(5 - 3w)\)
9. \(k(k - 3)\)
10. \(5h(3h - 2)\)
11. \(3(t^2 + 4)\)
12. \(3p(4p^3 - 5m)\)

13. \(3(4 - y)\)
14. \(2(5 - 3w)\)
15. \(4(t - 1)\)
16. \(3t(5t^2 - d^3)\)
17. \(3p(4p^3 - 5m)\)

18. \(4(5 + 2k)\)
19. \(5(2k + 3m)\)
20. \(2k(4 - k)\)
21. \(4(3d - 2m)\)
22. \(3(5t + 3)\)

Simplification

**Simplification** is the process whereby an expression is written down as simply as possible, any like terms being combined. Like terms are terms which have the same letter(s) raised to the same power and can differ only in their numerical coefficients (numbers in front). For example,

- \(m, 3m, 4m, -m\) and \(76m\) are all like terms in \(m\)
- \(t^2, 4t^2, 7t^2, -t^2, -3t^2\) and \(98t^2\) are all like terms in \(t^2\)
- \(pt, 5pt, -2pt, 7pt, -3pt\) and \(103pt\) are all like terms in \(pt\)

Note also that all the terms in \(lp\) are also like terms to all the terms in \(pt\).

In simplifying an expression, only like terms can be added or subtracted. For example,

- \(4m + 3m = 7m\)
- \(2t^2 + 5t^2 = 7t^2\)
- \(3ab + 2ba = 5ab\)

Expand and simplify

When two brackets are expanded there are often like terms that can be collected together. Algebraic expressions should always be simplified as much as possible.

**EXAMPLE 3**

\[3(4 + m) + 2(5 + 2m) = 12 + 3m + 10 + 4m = 22 + 7m\]

**EXAMPLE 4**

\[3t(5t + 4) - 2t(3t - 5) = 15t^2 + 12t - 6t^2 + 10t = 9t^2 + 22t\]
Factorisation is the opposite of expansion. It puts an expression back into the brackets it may have come from.

In factorisation, we have to look for the common factors in every term of the expression.
Factorise the following expressions.

**Example 5**

Factorise.  

- **a** \(6t + 9m\)  
- **b** \(6my + 4py\)  
- **c** \(5k^2 - 25k\)  
- **d** \(10a^2b - 15ab^2\)

**a** First look at the numerical coefficients 6 and 9. These have a common factor of 3. Then look at the letters, \(t\) and \(m\). These do not have any common factors as they do not appear in both terms. The expression can be thought of as \(3 \times 2t + 3 \times 3m\), which gives the factorisation

\[6t + 9m = 3(2t + 3m)\]

**Note:** you can always check a factorisation by expanding the answer.

**b** First look at the numbers, these have a common factor of 2. \(m\) and \(p\) do not occur in both terms but \(y\) does, and is a common factor, so the factorisation is

\[6my + 4py = 2y(3m + 2p)\]

**c** 5 is a common factor of 5 and 25 and \(k\) is a common factor of \(k^2\) and \(k\).

\[5k^2 - 25k = 5k(k - 5)\]

**d** 5 is a common factor of 10 and 15, \(a\) is a common factor of \(a^2\) and \(a\), \(b\) is a common factor of \(b\) and \(b^2\).

\[10a^2b - 15ab^2 = 5ab(2a - 3b)\]

**Note:** if you multiply out each answer, you will get the expressions you started with.

**Exercise 5D**

Factorise the following expressions.

1. \(6m + 12t\)  
2. \(9t + 3p\)  
3. \(8m + 12k\)  
4. \(4r + 8t\)  
5. \(mn + 3m\)  
6. \(5r^2 + 3g\)  
7. \(4w - 6t\)  
8. \(3y^2 + 2y\)  
9. \(4t^2 - 3t\)  
10. \(3m^2 - 3mp\)  
11. \(6p^2 + 9pt\)  
12. \(8pt + 6mp\)  
13. \(8ab - 4bc\)  
14. \(5b^2c - 10bc\)  
15. \(8abc + 6bed\)  
16. \(4a^2 + 6a + 8\)  
17. \(6ab + 9bc + 3bd\)  
18. \(5t^2 + 4t + at\)  
19. \(6mt^2 - 3mt + 9m^2t\)  
20. \(8ab^2 + 2ab - 4a^2b\)  
21. \(10pt^2 + 15pt + 5p^2t\)  
22. Factorise the following expressions where possible. List those which do not factorise.

- **a** \(7m - 6t\)  
- **b** \(5m + 2mp\)  
- **c** \(t^2 - 7t\)  
- **d** \(8pt + 5ab\)  
- **e** \(4m^2 - 6mp\)  
- **f** \(a^2 + b\)  
- **g** \(4a^2 - 5ab\)  
- **h** \(3ab + 4cd\)  
- **i** \(5ab - 3b^2c\)
5.3 Solving linear equations

In this section you will learn how to:

- solve equations in which the variable appears as part of the numerator of a fraction
- solve equations where you have to expand brackets first
- solve equations where the variable (the letter) appears on both sides of the equals sign
- set up equations from given information, and then solve them

Key words
brackets
do the same to both sides
equation
rearrange
solution
solve

Fractional equations

EXAMPLE 6

Solve this equation. \( \frac{x}{3} + 1 = 5 \)

First subtract 1 from both sides: \( \frac{x}{3} = 4 \)

Now multiply both sides by 3: \( x = 12 \)

EXAMPLE 7

Solve this equation. \( \frac{x - 2}{5} = 3 \)

First multiply both sides by 5: \( x - 2 = 15 \)

Now add 2 to both sides: \( x = 17 \)

EXAMPLE 8

Solve this equation. \( \frac{3x}{4} - 3 = 1 \)

First add 3 to both sides: \( \frac{3x}{4} = 4 \)

Now multiply both sides by 4: \( 3x = 16 \)

Now divide both sides by 3: \( x = \frac{16}{3} = 5 \frac{1}{3} \)
Solve these equations.

1. \( \frac{f}{3} + 2 = 8 \)
2. \( \frac{w}{3} - 5 = 2 \)
3. \( \frac{x}{8} + 3 = 12 \)
4. \( \frac{5r}{4} + 3 = 18 \)
5. \( \frac{3y}{2} - 1 = 8 \)
6. \( \frac{2x}{3} + 5 = 12 \)
7. \( \frac{x}{3} + 3 = 1 \)
8. \( \frac{x + 3}{2} = 5 \)
9. \( \frac{t - 5}{2} = 3 \)
10. \( \frac{x + 10}{2} = 3 \)
11. \( \frac{2x + 1}{3} = 5 \)
12. \( \frac{5y - 2}{4} = 3 \)
13. \( \frac{6y + 3}{9} = 1 \)
14. \( \frac{2x - 3}{5} = 4 \)
15. \( \frac{5r + 3}{4} = 1 \)

**Brackets**

When we have an equation which contains brackets, we first must multiply out the brackets and then solve the resulting equation.

**EXAMPLE 9**

Solve \( 5(x + 3) = 25 \).

First multiply out the bracket to get:

\[ 5x + 15 = 25 \]

Rearrange:

\[ 5x = 25 - 15 = 10 \]

Divide by 5:

\[ \frac{5x}{5} = \frac{10}{5} \]

\[ x = 2 \]

**EXAMPLE 10**

Solve \( 3(2x - 7) = 15 \).

Multiply out the bracket to get:

\[ 6x - 21 = 15 \]

Add 21 to both sides:

\[ 6x = 36 \]

Divide both sides by 6:

\[ x = 6 \]
Solve each of the following equations. Some of the answers may be decimals or negative numbers. Remember to check that each answer works for its original equation. Use your calculator if necessary.

\[2(x + 5) = 16\]
\[3(y + 1) = 18\]
\[2(3y - 5) = 14\]
\[4(3t - 2) = 88\]
\[2(3x + 1) = 11\]
\[6(3k + 5) = 39\]
\[9(3x - 5) = 9\]
\[3(y + 7) = 15\]

\[5(x - 3) = 20\]
\[4(2x + 5) = 44\]
\[5(4x + 3) = 135\]
\[6(2x + 5) = 42\]
\[4(5y - 2) = 42\]
\[2(3x + 11) = 10\]
\[5(x - 4) = -25\]
\[4(5t + 8) = 12\]

**Equations with the variable on both sides**

When a letter (or variable) appears on both sides of an equation, it is best to use the “do the same to both sides” method of solution, and collect all the terms containing the letter on the left-hand side of the equation. But when there are more of the letter on the right-hand side, it is easier to turn the equation round. When an equation contains brackets, they must be multiplied out first.

**EXAMPLE 11**

Solve \(5x + 4 = 3x + 10\).

There are more \(x\)s on the left-hand side, so leave the equation as it is.

Subtract \(3x\) from both sides: \(2x + 4 = 10\)

Subtract \(4\) from both sides: \(2x = 6\)

Divide both sides by \(2\): \(x = 3\)

**EXAMPLE 12**

Solve \(2x + 3 = 6x - 5\).

There are more \(x\)s on the right-hand side, so turn round the equation.

\(6x - 5 = 2x + 3\)

Subtract \(2x\) from both sides: \(4x - 5 = 3\)

Add \(5\) to both sides: \(4x = 8\)

Divide both sides by \(4\): \(x = 2\)
Solve each of the following equations.

1. \(2x + 3 = x + 5\)
2. \(4a - 3 = 3a + 4\)
3. \(7p - 5 = 3p + 3\)
4. \(4m + 1 = m + 10\)
5. \(2(d + 3) = d + 12\)
6. \(3(2y + 3) = 5(2y + 1)\)
7. \(4(3b - 1) + 6 = 5(2b + 4)\)

---

**Section: Setting up linear equations**

Equations are used to represent situations, so that we can solve real-life problems.

**Example 14**

A milkman sets off from the dairy with eight crates of milk, each containing \(b\) bottles. He delivers 92 bottles to a large factory and finds that he has exactly 100 bottles left on his milk float. How many bottles were in each crate?

The equation is: \(8b - 92 = 100\)

\(8b = 192\) (Add 92 to both sides)

\(b = 24\) (Divide both sides by 8)

Checking the answer gives: \(8 \times 24 - 92 = 192 - 92 = 100\)

which is correct.
Set up an equation to represent each situation described below. Then solve the equation. Do not forget to check each answer.

A man buys a daily paper from Monday to Saturday for \( d \) pence. On Sunday he buys the Observer for \( £1.60 \). His weekly paper bill is \( £4.90 \).
How much is his daily paper?

The diagram shows a rectangle.

**a** What is the value of \( x \)?

**b** What is the value of \( y \)?

In this rectangle, the length is 3 centimetres more than the width. The perimeter is 12 cm.

**a** What is the value of \( x \)?

**b** What is the area of the rectangle?

Mary has two bags of sweets, each of which contains the same number of sweets. She eats four sweets. She then finds that she has 30 sweets left. How many sweets were in each bag to start with?
A boy is \( Y \) years old. His father is 25 years older than he is. The sum of their ages is 31. How old is the boy?

Another boy is \( X \) years old. His sister is twice as old as he is. The sum of their ages is 27. How old is the boy?

The diagram shows a square.

Find \( x \) if the perimeter is 44 cm.

Max thought of a number. He then multiplied his number by 3. He added 4 to the answer. He then doubled that answer to get a final value of 38. What number did he start with?

---

**5.4 Trial and improvement**

In this section you will learn how to:

- estimate the answer to some equations that do not have exact solutions, using the method of trial and improvement

Key words

- comment
- decimal place
- guess
- trial and improvement

Certain equations cannot be solved exactly. However, a close enough solution to such an equation can be found by the trial-and-improvement method (sometimes wrongly called the trial-and-error method).

The idea is to keep trying different values in the equation which will take it closer and closer to its “true” solution. This step-by-step process is continued until a value is found which gives a solution that is close enough to the accuracy required.

The trial-and-improvement method is the way in which computers are programmed to solve equations.
EXAMPLE 16

Find a solution to the equation \( x^3 + x = 105 \), giving the solution to 1 decimal place.

The best way to do this is to set up a table to show working. There will be three columns: guess (the trial); the equation we are solving; and a comment whether the value of the guess is too high or too low.

**Step 1** We must find the two consecutive whole numbers between which \( x \) lies. We do this by intelligent guessing.

- Try \( x = 5 \): \( 125 + 5 = 130 \) Too high – next trial needs to be smaller
- Try \( x = 4 \): \( 64 + 4 = 68 \) Too low

So we now know that a solution lies between \( x = 4 \) and \( x = 5 \).

**Step 2** We must find the two consecutive one-decimal place numbers between which \( x \) lies.

- Try 4.5, which is halfway between 4 and 5.
  - This gives \( 91.125 + 4.5 = 95.625 \) Too small
- So we attempt to improve this by trying 4.6.
  - This gives \( 97.536 + 4.6 = 101.936 \) Still too small
  - Try 4.7, which gives 108.523. This is too high, so we know the solution is between 4.6 and 4.7.

It looks as though 4.6 is closer but there is a very important final step. Never assume that the one-decimal place number that gives the closest value to a solution is the answer.

**Step 3** Now try the value that is halfway between the two one-decimal place values.

In this case \( 4.65 \).

- This gives \( 105.194625 \) Too high

This means that an actual solution is between 4.60 and 4.65.

The diagram and table summarise our results.

<table>
<thead>

</tbody>
</table>

The approximate answer is \( x = 4.6 \) to 1 decimal place.
For each of the following equations, find a pair of consecutive whole numbers, between which a solution lies.

a \( x^2 + x = 24 \)

b \( x^3 + 2x = 80 \)

c \( x^3 - x = 20 \)

Copy and complete the table to find an approximate solution, using trial and improvement, to this equation.

\( x^3 + 2x = 50 \)

Guess | \( x^3 + 2x \) | Comment
--- | --- | ---
3 | 33 | Too low
4 | 72 | Too high

Give your answer to 1 decimal place.

Copy and complete the table to find an approximate solution, using trial and improvement, to this equation.

\( x^3 - 3x = 40 \)

Guess | \( x^3 - 3x \) | Comment
--- | --- | ---
4 | 52 | Too high

Give your answer to 1 decimal place.

Use trial and improvement to find an approximate solution to this equation.

\( 2x^3 + x = 35 \)

Give your answer to 1 decimal place.

You are given that the solution lies between 2 and 3.

Use trial and improvement to find an exact solution to this equation.

\( 4x^2 + 2x = 12 \)

Do not use a calculator.

Find a solution to each of the following equations to 1 decimal place.

a \( 2x^3 + 3x = 35 \)

b \( 3x^3 - 4x = 52 \)

c \( 2x^3 + 5x = 79 \)

A rectangle has an area of 100 cm\(^2\). Its length is 5 cm longer than its width.

a Show that, if \( x \) is the width then \( x^2 + 5x = 100 \)

b Find, correct to 1 decimal place, the dimensions of the rectangle.

Use trial and improvement to find a solution to the equation \( x^2 + x = 30 \).

I want to find a number that when you square it and add it to itself the answer is 30.
A pair of **simultaneous equations** is exactly that – two equations (usually linear) for which we want the **same** solution, and which we therefore solve **together**. For example,

\[ x + y = 10 \] has many solutions:
\[ x = 2, \ y = 8 \quad x = 4, \ y = 6 \quad x = 5, \ y = 5 \ldots \]

and \[ 2x + y = 14 \] has many solutions:
\[ x = 2, \ y = 10 \quad x = 3, \ y = 8 \quad x = 4, \ y = 6 \ldots \]

But only one solution, \[ x = 4 \] and \[ y = 6 \], satisfies both equations at the same time.

**Elimination method**

Here, we solve simultaneous equations by the *elimination method*. There are six steps in this method. Step 1 is to **balance** the coefficients of one of the variables. Step 2 is to **eliminate** this variable by adding or subtracting the equations. Step 3 is to solve the resulting linear equation in the other variable. Step 4 is to **substitute** the value found back into one of the previous equations. Step 5 is to solve the resulting equation. Step 6 is to **check** that the two values found satisfy the original equations.

**EXAMPLE 17**

Solve the equations \[ 6x + y = 15 \] and \[ 4x + y = 11 \].

The equations should be labelled so that the method can be clearly explained.

\[ 6x + y = 15 \] \hspace{1cm} (1)
\[ 4x + y = 11 \] \hspace{1cm} (2)

**Step 1:** Since the y-term in both equations has the same coefficient there is no need to balance them.
Substitution method

This is an alternative method (which is covered again on page 490). Which method you use depends very much on the coefficients of the variables and the way that the equations are written in the first place.

There are five steps in the substitute method. Step 1 is to rearrange one of the equations into the form $y = \ldots$ or $x = \ldots$. Step 2 is to substitute the right hand side of this equation into the other equation in place of the variable on the left hand side. Step 3 is to expand and solve this equation. Step 4 is to substitute the value into the $y = \ldots$ or $x = \ldots$ equation. Step 5 is to check that the values work in both original equations.
In this exercise the coefficients of one of the variables in questions 1 to 9 are the same so there is no need to balance them. Subtract the equations when the identical terms have the same sign. Add the equations when the identical terms have opposite signs. In questions 10 to 12 use the substitution method.

Solve these simultaneous equations.

1. \(4x + y = 17\)  
   \(2x + y = 9\)

2. \(5x + 2y = 13\)  
   \(x + 2y = 9\)

3. \(3x + 2y = 11\)  
   \(2x - 2y = 14\)

4. \(x + 3y = 9\)  
   \(x + y = 6\)

5. \(2x + 5y = 37\)  
   \(y = 11 - 2x\)

6. \(2x + y = 7\)  
   \(5x - y = 14\)

7. \(3x - 4y = 17\)  
   \(x - 4y = 3\)

8. \(3x + 2y = 16\)  
   \(x - 2y = 4\)

9. \(3x - y = 9\)  
   \(5x + y = 11\)

10. \(4x - 3y = 7\)  
    \(x = 13 - 3y\)

11. \(4x - y = 17\)  
    \(x = 2 + y\)

You were able to solve all the pairs of equations in Exercise 5J simply by adding or subtracting the equations in each pair, or just by substituting without rearranging. This does not always happen. The next examples show you what to do when there are no identical terms to begin with, or when you need to rearrange.
EXAMPLE 20

Solve these equations.

\[ \begin{align*} 3x + 2y &= 18 \quad (1) \\ 2x - y &= 5 \quad (2) \end{align*} \]

**Step 1:** Multiply equation (2) by 2. There are other ways to balance the coefficients but this is the easiest and leads to less work later. You will get used to which will be the best way to balance the coefficients.

\[ 2 \times (2) \Rightarrow 4x - 2y = 10 \quad (3) \]

Label this equation as number (3).

Be careful to multiply every term and not just the \( y \) term; it sometimes helps to write:

\[ 2 \times (2 - y = 5) \Rightarrow 4x - 2y = 10 \quad (3) \]

**Step 2:** As the signs of the \( y \)-terms are opposite, add the equations.

\[ (1) + (3) \Rightarrow 7x = 28 \]

Be careful to add the correct equations. This is why labelling them is useful.

**Step 3:** Solve this equation: \( x = 4 \)

**Step 4:** Substitute \( x = 4 \) into any equation, say \( 2x - y = 5 \) ⇒ \( 8 - y = 5 \)

**Step 5:** Solve this equation: \( y = 3 \)

**Step 6:** Check: (1), \( 3 \times 4 + 2 \times 3 = 18 \) and (2), \( 2 \times 4 - 3 = 5 \), which are correct so the solution is \( x = 4 \) and \( y = 3 \).

EXAMPLE 21

Solve the simultaneous equations \( 3x + y = 5 \) and \( 5x - 2y = 12 \) using the substitution method.

Looking at the equations there is only one that could be sensibly rearranged without involving fractions.

**Step 1:** Rearrange \( 3x + y = 5 \) to get \( y = 5 - 3x \) \( (1) \)

**Step 2:** Substitute \( y = 5 - 3x \) into \( 5x - 2y = 12 \) \( (2) \)

\[ 5x - 2(5 - 3x) = 12 \]

**Step 3:** Expand and solve \( 5x - 10 + 6x = 12 \) ⇒ \( 11x = 22 \) ⇒ \( x = 2 \)

**Step 4:** Substitute into equation (1): \( y = 5 - 3 \times 2 = 5 - 6 = -1 \)

**Step 5:** Check: (1), \( 3 \times 2 + (-1) = 5 \) and (2), \( 5 \times 2 - 2 \times (-1) = 10 + 2 = 12 \), which are correct so the solution is \( x = 2 \) and \( y = -1 \).
Solve questions 1 to 3 by the substitution method and the rest by first changing one of the equations in each pair to obtain identical terms, and then adding or subtracting the equations to eliminate those terms.

</tr>
<tr>
<td>11</td>
<td>2x + 3y = 13</td>
<td>5x + 6y = 12</td>
</tr>
</tbody>
</table>

There are also cases where both equations have to be changed to obtain identical terms. The next example shows you how this is done.

Note the substitution method is not suitable for these type of equations as you end up with fractional terms.

**EXAMPLE 22**

Solve these equations.  

\[ 4x + 3y = 27 \quad (1) \]
\[ 5x - 2y = 5 \quad (2) \]

Both equations have to be changed to obtain identical terms in either \( x \) or \( y \). However, we can see that if we make the \( y \)-coefficients the same, we will add the equations. This is always safer than subtraction, so this is obviously the better choice. We do this by multiplying the first equation by 2 (the \( y \)-coefficient of the other equation) and the second equation by 3 (the \( y \)-coefficient of the other equation).

**Step 1:**  
\[ (1) \times 2 \text{ or } 2 \times (4x + 3y = 27) \Rightarrow 8x + 6y = 54 \quad (3) \]
\[ (2) \times 3 \text{ or } 3 \times (5x - 2y = 5) \Rightarrow 15x - 6y = 15 \quad (4) \]

Label the new equations (3) and (4).

**Step 2:** Eliminate one of the variables:  
\[ (3) + (4) \quad 23x = 69 \]

**Step 3:** Solve the equation:  
\[ x = 3 \]

**Step 4:** Substitute into equation (1):  
\[ 12 + 3y = 27 \]

**Step 5:** Solve the equation:  
\[ y = 5 \]

**Step 6:** Check: (1), \( 4 \times 3 + 3 \times 5 = 12 + 15 = 27 \), and (2), \( 5 \times 3 - 2 \times 5 = 15 - 10 = 5 \), which are correct so the solution is \( x = 3 \) and \( y = 5 \).
Solve the following simultaneous equations.

1. \(2x + 5y = 15\)
   \(3x - 2y = 13\)
2. \(3x - 2y = 15\)
   \(2x - 3y = 5\)
3. \(2x + y = 4\)
   \(x - y = 5\)
4. \(3x + 2y = 2\)
   \(2x + 6y = 13\)
5. \(3x - y = 5\)
   \(x + 3y = -20\)
6. \(2x + 3y = 30\)
   \(5x + 7y = 71\)
7. \(3x + 2y = 28\)
   \(2x + 7y = 47\)
8. \(5x - 3y = 14\)
   \(4x - 5y = 6\)
9. \(5x + 2y = 11\)
   \(3x + 4y = 8\)
10. \(x - 2y = 4\)
    \(3x - y = -3\)
11. \(6x + 2y = 14\)
    \(3x - 5y = 10\)
12. \(2x + 4y = 15\)
    \(x + 5y = 21\)
13. \(3x - 4y = 4.5\)
    \(2x + 2y = 10\)
14. \(x - 5y = 15\)
    \(3x - 7y = 17\)

Solving problems by using simultaneous equations

We are now going to meet a type of problem which has to be expressed as a pair of simultaneous equations so that it can be solved. The next example shows you how to tackle such a problem.

**Example 23**

On holiday last year, I was talking over breakfast to two families about how much it cost them to go to the theatre. They couldn’t remember how much was charged for each adult or each child, but they could both remember what they had paid altogether.

The Advani family, consisting of Mr and Mrs Advani with their daughter Rupa, paid £23.

The Shaw family, consisting of Mrs Shaw with her two children, Len and Sue, paid £17.50.

How much would I have to pay for my wife, my four children and myself?

We make a pair of simultaneous equations from the situation as follows.

Let \(x\) be the cost of an adult ticket, and \(y\) be the cost of a child’s ticket. Then

\(2x + y = 23\) for the Advani family

and \(x + 2y = 17.5\) for the Shaw family.

We solve these equations just as we have done in the previous examples, to obtain

\(x = £9.50\) and \(y = £4\). I can now find my cost, which will be

\((2 \times £9.50) + (4 \times £4) = £35\).
Read each situation carefully, then make a pair of simultaneous equations in order to solve the problem.

1. Amul and Kim have £10.70 between them. Amul has £3.70 more than Kim. Let \( x \) be the amount Amul has and \( y \) be the amount Kim has. Set up a pair of simultaneous equations. How much does each have?

2. The two people in front of me at the Post Office were both buying stamps. One person bought 10 second-class and five first-class stamps at a total cost of £3.45. The other bought eight second-class and 10 first-class stamps at a total cost of £4.38.
   a. Let \( x \) be the cost of second-class stamps and \( y \) be the cost of first-class stamps. Set up two simultaneous equations.
   b. How much did I pay for 3 second-class and 4 first-class stamps?

3. At a local tea room I couldn’t help noticing that at one table, where the customers had eaten six buns and had three teas, the bill came to £4.35. At another table, the customers had eaten 11 buns and had seven teas at a total cost of £8.80.
   a. Let \( x \) be the cost of a bun and \( y \) be the cost of a cup of tea. Show the situation as a pair of simultaneous equations.
   b. My family and I had five buns and six teas. What did it cost us?

4. Three chews and four bubblies cost 72p. Five chews and two bubblies cost 64p. What would three chews and five bubblies cost?

5. On a nut-and-bolt production line, all the nuts weighed the same and all the bolts weighed the same. An order of 50 nuts and 60 bolts weighed 10.6 kg. An order of 40 nuts and 30 bolts weighed 6.5 kg. What should an order of 60 nuts and 50 bolts weigh?

6. A taxi firm charges a fixed amount plus so much per mile. A journey of 6 miles costs £3.70. A journey of 10 miles costs £5.10. What would be the cost of a journey of 8 miles?

7. Two members of the same church went to the same shop to buy material to make Christingles. One bought 200 oranges and 220 candles at a cost of £65.60. The other bought 210 oranges and 200 candles at a cost of £63.30. They only needed 200 of each. How much should it have cost them?

8. When you book Bingham Hall for a conference, you pay a fixed booking fee plus a charge for each delegate at the conference. The total charge for a conference with 65 delegates was £192.50. The total charge for a conference with 40 delegates was £180. What will be the charge for a conference with 70 delegates?

9. My mother-in-law uses this formula to cook a turkey:
   \[ T = a + bW \]
   where \( T \) is the cooking time (minutes), \( W \) is the weight of the turkey (kg), and \( a \) and \( b \) are constants. She says it takes 4 hours 30 minutes to cook a 12 kg turkey, and 3 hours 10 minutes to cook an 8 kg turkey. How long will it take to cook a 5 kg turkey?
The subject of a formula is the variable (letter) in the formula which stands on its own, usually on the left-hand side of the equals sign. For example, \( x \) is the subject of each of the following equations.

\[
\begin{align*}
  x &= 5t + 4 \\
  x &= 4(2y - 7) \\
  x &= \frac{1}{t}
\end{align*}
\]

If we wish to change the existing subject to a different variable, we have to rearrange (transpose) the formula to get that variable on the left-hand side. We do this by using the same rules as for solving equations. Move the terms concerned from one side of the equals sign to the other. The main difference is that when you solve an equation each step gives a numerical value. When you rearrange a formula each step gives an algebraic expression.

**EXAMPLE 24**

Make \( m \) the subject of this formula.

\[
T = m - 3
\]

Move the 3 away from the \( m \).

\[
T + 3 = m
\]

Reverse the formula.

\[
m = T + 3
\]

**EXAMPLE 25**

From the formula \( P = 4t \), express \( t \) in terms of \( P \).

(This is another common way of asking you to make \( t \) the subject.)

Divide both sides by 4:

\[
\frac{P}{4} = \frac{4t}{4}
\]

Reverse the formula:

\[
t = \frac{P}{4}
\]

**EXAMPLE 26**

From the formula \( C = 2m^2 + 3 \), make \( m \) the subject.

Move the 3 away from the \( 2m^2 \):

\[
C - 3 = 2m^2
\]

Divide both sides by 2:

\[
\frac{C - 3}{2} = \frac{2m^2}{2}
\]

Reverse the formula:

\[
m^2 = \frac{C - 3}{2}
\]

Square root both sides:

\[
m = \sqrt{\frac{C - 3}{2}}
\]
Remember about inverse operations, and the rule "change sides, change signs".

1. \( T = 3k \) Make \( k \) the subject.
2. \( X = y - 1 \) Express \( y \) in terms of \( X \).
3. \( Q = \frac{P}{3} \) Express \( P \) in terms of \( Q \).
4. \( A = 4r + 9 \) Make \( r \) the subject.
5. \( W = 3n - 1 \) Make \( n \) the subject.
6. \( p = m + t \) a Make \( m \) the subject. b Make \( t \) the subject.
7. \( g = \frac{m}{\nu} \) Make \( m \) the subject.
8. \( t = m^2 \) Make \( m \) the subject.
9. \( C = 2\pi r \) Make \( r \) the subject.
10. \( A = bh \) Make \( b \) the subject.
11. \( P = 2l + 2w \) Make \( l \) the subject.
12. \( m = p^2 + 2 \) Make \( p \) the subject.
13. \( v = u + at \) a Make \( a \) the subject. b Make \( t \) the subject.
14. \( A = \frac{1}{4} \pi d^2 \) Make \( d \) the subject.
15. \( W = 3n + t \) a Make \( n \) the subject. b Express \( t \) in terms of \( n \) and \( W \).
16. \( x = 5y - w \) a Make \( y \) the subject. b Express \( w \) in terms of \( x \) and \( y \).
17. \( k = 2p^2 \) Make \( p \) the subject.
18. \( v = u^2 - t \) a Make \( t \) the subject. b Make \( u \) the subject.
19. \( k = m + n^2 \) a Make \( m \) the subject. b Make \( n \) the subject.
20. \( T = 5r^2 \) Make \( r \) the subject.
21. \( K = 5n^2 + w \) a Make \( w \) the subject. b Make \( n \) the subject.
**Exam Questions**

a Multiply out \(3(4x - 5)\)
b Solve \(3(4x - 5) = 27\)

Solve the equation \(7x - 1 = 3(x + 2)\)

a Expand the brackets \((pq - p^2)\)
b Expand and simplify \(5(3p + 2) - 2(5p - 3)\)

Edexcel, Question 3, Paper 5 Higher, November 2004

d Expand and simplify \(3(4x - 3) + 2(x + 5)\)
b Expand \(2x(x^2 - 3x)\)
c Expand and simplify \((x + 2)(x - 1)\)

a Make \(t\) the subject of the formula \(s = 2 - 3t\)
b Solve the equation \(\frac{1}{3}x - 4 = \frac{1}{2}x + 2\)

Solve the equations

a \(\frac{14 - t}{5} = 4\)
b \(\frac{3x + 9}{3} - \frac{2x + 4}{5} = 4\)

a Expand and simplify \((3q - 2)(y + 5)\)
b Expand \(t^2(5 - 2t)\)

Make \(t\) the subject of the formula \(t^2 + s = 10\)

Make \(t\) the subject of the formula \(5t + 3p = 5p - 7\)
Simplify your answer as much as possible.

A company bought a van that had a value of £12 000. Each year the value of the van depreciates by 25%. a Work out the value of the van at the end of three years.

The company bought a new truck. Each year the value of the truck depreciates by 20%. The value of the new truck can be multiplied by a single number to find its value at the end of four years.
b Find this single number as a decimal.

Edexcel, Question 12, Paper 6 Higher, June 2004

Wendy does a 25 kilometre mountain race. She ran \(x\) kilometres to the top of the mountain at a speed of 9 km/h and then \(y\) kilometres to the finish at a speed of 12 km/h. She finishes the race in 2 hours and 20 minutes.

By setting up two simultaneous equations in \(x\) and \(y\), find how long it took Wendy to reach the top of the mountain.

Consider the simultaneous equations

\(y = x + 1\)
\(y^2 = x + 6\)

a Show why \(x\) is the solution of the equation \(x^2 + x - 5 = 0\)
b Use trial and improvement to find a positive solution to \(x^2 + x - 5 = 0\). Give your answer to 1 decimal place.
WORKED EXAM QUESTIONS

1. Solve these simultaneous equations algebraically. Show your method clearly.

\[4x + 3y = 23\]  
\[3x - 2y = 13\]

Label the equations and decide on the best way to get the coefficients of one variable the same.

\(1 \times 2\) \quad 8x + 6y = 46  
\(2 \times 3\) \quad 9x - 6y = 39  
\(3 + 4\) \quad 17x = 85

Making the \(y\) coefficients the same will be the most efficient way as the resulting equations will be added.

\[x = 5\]

Substitute into (1) \quad 20 + 3y = 23

Solve the resulting equation and substitute into one of the original equations to find the other value.

\[y = 1\]

Check that these values work in the original equations.

\[4 \times 5 + 3 \times 1 = 23\]

\[3 \times 5 - 2 \times 1 = 13\]

2. Temperatures can be measured in degrees Celsius (°C), degrees Fahrenheit (°F) or degrees Kelvin (°K). The relationships between the scales of temperature are given by

\[C = \frac{5(F - 32)}{9}\]  
\[K = C + 273\]

Express \(F\)

(i) in terms of \(C\)

(ii) in terms of \(K\)

Multiply both sides of the first equation by 9, then expand the bracket. Add 160 to both sides and change the equation round. Divide both sides by 5. Make sure you divide all of the right-hand side by 5.

(i) \[9C = 5(F - 32)\]

\[9C = 5F - 160\]

\[5F = 9C + 160\]

\[F = \frac{9C + 160}{5}\]

(ii) \[C = K - 273\]

\[F = \frac{9(K - 273) + 160}{5}\]

\[F = \frac{9K - 2457 + 160}{5}\]

\[F = \frac{9K - 2297}{5}\]

Make \(C\) the subject of the second equation. Substitute for \(C\) in the answer to part i, expand the bracket and tidy up the top line of the fraction.
Julia starts her new job at a riding stables, where she is responsible for six new horses. She measures the length and girth of each horse, and then uses the bodyweight calculator to work out its weight in kilograms. She then uses the feed chart and worming paste instructions to calculate how much feed and worming paste each horse needs.

Copy the stewardship table and help her to complete it for these six horses.

### Stewardship table

- **Summer**
  - Girth: 220 cm
  - Length: 142 cm
  - Work: Medium

- **Sally**
  - Girth: 190 cm
  - Length: 95 cm
  - Work: Hard

- **Skip**
  - Girth: 200 cm
  - Length: 114 cm
  - Work: Hard
Julia is hopeless at simultaneous equations. Work out for her the cost for an adult and the cost for a child to go on this ride.

During her first day, Julia sees a group of three adults and two children pay £136.50 for a 1 1⁄2 hour ride. Then another group of four adults and five children pay £241.50 to go on the same ride.

Worming paste instructions

Barney
- girth: 160 cm
- length: 110 cm
- work: medium

Teddy
- girth: 190 cm
- length: 140 cm
- work: hard

Instructions for using the bodyweight calculator
Put a ruler from the girth line to the length line. Where the ruler crosses the weight line is the approximate weight of the horse. Give each horse’s weight to the nearest 10 kg.
GRADE YOURSELF

- Able to expand a linear bracket
- Able to substitute numbers into expressions
- Able to factorise simple linear expressions
- Able to solve simple linear equations which include the variable inside a bracket
- Able to solve linear equations where the variable occurs in the numerator of a fraction
- Able to solve linear equations where the variable appears on both sides of the equals sign.
- Able to expand and simplify expressions
- Able to solve equations using trial and improvement
- Able to rearrange simple formulae
- Able to solve two simultaneous linear equations
- Able to rearrange more complicated formulae
- Able to set up and solve two simultaneous equations from a practical problem

What you should know now

- How to manipulate and simplify algebraic expressions, including those with linear brackets
- How to factorise linear expressions
- How to solve all types of linear equations
- How to find a solution to equations by trial and improvement
- How to set up and/or solve a pair of linear simultaneous equations
This chapter will show you ...
- how to use Pythagoras’ theorem in right-angled triangles
- how to solve problems using Pythagoras’ theorem
- how to use trigonometric ratios in right-angled triangles
- how to use trigonometry to solve problems

What you should already know
- how to find the square and square root of a number
- how to round numbers to a suitable degree of accuracy

Quick check ➔ ANSWERS
Use your calculator to evaluate the following, giving your answers to one decimal place.

1. \( 2.3^2 \)
2. \( 15.7^2 \)
3. \( 0.78^2 \)
4. \( \sqrt{8} \)
5. \( \sqrt{260} \)
6. \( \sqrt{0.5} \)
Pythagoras, who was a philosopher as well as a mathematician, was born in 580 BC, on the island of Samos in Greece. He later moved to Crotona (Italy), where he established the Pythagorean Brotherhood, which was a secret society devoted to politics, mathematics and astronomy. It is said that when he discovered his famous theorem, he was so full of joy that he showed his gratitude to the gods by sacrificing a hundred oxen.

Consider squares being drawn on each side of a right-angled triangle, with sides 3 cm, 4 cm and 5 cm.

The longest side is called the **hypotenuse** and is always opposite the right angle.

**Pythagoras’ theorem** can then be stated as follows:

*For any right-angled triangle, the area of the square drawn on the hypotenuse is equal to the sum of the areas of the squares drawn on the other two sides.*

The form in which most of your parents would have learnt the theorem when they were at school – and which is still in use today – is as follows:

*In any right-angled triangle, the square of the hypotenuse is equal to the sum of the squares of the other two sides.*

Pythagoras’ theorem is more usually written as a formula:

\[ c^2 = a^2 + b^2 \]

Remember that Pythagoras’ theorem can only be used in right-angled triangles.

**Finding the hypotenuse**

**EXAMPLE 1**

Find the length of the hypotenuse, marked \( x \) on the diagram.

Using Pythagoras’ theorem gives

\[ x^2 = 8^2 + 5.2^2 \text{ cm}^2 \]
\[ = 64 + 27.04 \text{ cm}^2 \]
\[ = 91.04 \text{ cm}^2 \]

So \( x = \sqrt{91.04} = 9.5 \text{ cm} \) (1 decimal place)
For each of the following triangles, calculate the length of the hypotenuse, \( x \), giving your answers to one decimal place.

The last three examples give whole number answers. Sets of whole numbers that obey Pythagoras’ theorem are called Pythagorean triples. For example,

\[ 3, 4, 5 \quad 5, 12, 13 \quad \text{and} \quad 6, 8, 10. \]

Note that 6, 8, 10 are respectively multiples of 3, 4, 5.
By rearranging the formula for Pythagoras' theorem, the length of one of the shorter sides can easily be calculated.

\[ c^2 = a^2 + b^2 \]

So, \( a^2 = c^2 - b^2 \) or \( b^2 = c^2 - a^2 \)

**EXAMPLE 2**

Find the length \( x \).

- \( x \) is one of the shorter sides

So using Pythagoras' theorem gives

\[ x^2 = 15^2 - 11^2 \text{ cm}^2 \]
\[ = 225 - 121 \text{ cm}^2 \]
\[ = 104 \text{ cm}^2 \]

So \( x = \sqrt{104} = 10.2 \text{ cm (one decimal place)} \)

**EXERCISE 6B**

For each of the following triangles, calculate the length \( x \), giving your answers to one decimal place.

**HINTS AND TIPS**

In these examples you are finding a short side. The square of the other short side is subtracted from the square of the hypotenuse in every case.
For each of the following triangles, calculate the length $x$, giving your answers to one decimal place.

For each of the following triangles, find the length marked $x$.

**6.3 Solving problems using Pythagoras’ theorem**

In this section you will learn how to:

- solve problems using Pythagoras’ theorem

**Key words**

- 3-D
- isosceles triangle
- Pythagoras’ theorem

**Pythagoras’ theorem** can be used to solve certain practical problems. When a problem involves two lengths only, follow these steps.

- Draw a diagram for the problem that includes a right-angled triangle.
- Look at the diagram and decide which side has to be found: the hypotenuse or one of the shorter sides. Label the unknown side $x$.
- If it’s the hypotenuse, then square both numbers, add the squares and take the square root of the sum.
If it’s one of the shorter sides, then square both numbers, subtract the squares and take the square root of the difference.

Finally, round off the answer to a suitable degree of accuracy.

Remember the following tips when solving problems.

• Always sketch the right-angled triangle you need. Sometimes, the triangle is already drawn for you but some problems involve other lines and triangles that may confuse you. So identify which right-angled triangle you need and sketch it separately.

• Label the triangle with necessary information, such as the length of its sides, taken from the question. Label the unknown side $x$.

• Set out your solution as in Example 3. Avoid short cuts, since they often cause errors. You gain marks in your examination for clearly showing how you are applying Pythagoras' theorem to the problem.

• Round your answer off to a suitable degree of accuracy.

**EXAMPLE 3**

A plane leaves Manchester airport heading due east. It flies 160 km before turning due north. It then flies a further 280 km and lands. What is the distance of the return flight if the plane flies straight back to Manchester airport?

First, sketch the situation.

Using Pythagoras' theorem gives

\[ x^2 = 160^2 + 280^2 \text{ km}^2 \]

\[ = 25,600 + 78,400 \text{ km}^2 \]

\[ = 104,000 \text{ km}^2 \]

So $x = \sqrt{104,000} = 322$ km (3 significant figures)

**EXERCISE 6C**

1. A ladder, 12 metres long, leans against a wall. The ladder reaches 10 metres up the wall. How far away from the foot of the wall is the foot of the ladder?

2. A model football pitch is 2 metres long and 0.5 metre wide. How long is the diagonal?
How long is the diagonal of a square with a side of 8 metres?

A ship going from a port to a lighthouse steams 15 km east and 12 km north. How far is the lighthouse from the port?

Some pedestrians want to get from point X on one road to point Y on another. The two roads meet at right angles.

a. If they follow the roads, how far will they walk?

b. Instead of walking along the road, they take the shortcut, XY. Find the length of the shortcut.

c. How much distance do they save?

A mast on a sailboat is strengthened by a wire (called a stay), as shown on the diagram. The mast is 10 m tall and the stay is 11 m long. How far from the base of the mast does the stay reach?

A ladder, 4 m long, is put up against a wall.

a. How far up the wall will it reach when the foot of the ladder is 1 m away from the wall?

b. When it reaches 3.6 m up the wall, how far is the foot of the ladder away from the wall?

A pole, 8 m high, is supported by metal wires, each 8.6 m long, attached to the top of the pole. How far from the foot of the pole are the wires fixed to the ground?

How long is the line that joins the two coordinates A(13, 6) and B(1, 1)?
The regulation for safe use of ladders states that: the foot of a 5 m ladder must be placed between 1.6 m and 2.1 m from the foot of the wall.

a. What is the maximum height the ladder can safely reach up the wall?
b. What is the minimum height the ladder can safely reach up the wall?

Is the triangle with sides 7 cm, 24 cm and 25 cm, a right-angled triangle?

**Pythagoras’ theorem and isosceles triangles**

This section shows you how to use Pythagoras’ theorem in isosceles triangles.

Every isosceles triangle has a line of symmetry that divides the triangle into two congruent right-angled triangles. So when you are faced with a problem involving an isosceles triangle, be aware that you are quite likely to have to split that triangle down the middle to create a right-angled triangle which will help you to solve the problem.

**EXAMPLE 4**

Calculate the area of this triangle.

It is an isosceles triangle and you need to calculate its height to find its area.

First split the triangle into two right-angled triangles to find its height.

Let the height be \(x\).

Then, using Pythagoras’ theorem,

\[
x^2 = 7.5^2 - 3^2 \text{ cm}^2
\]

\[
x^2 = 56.25 - 9 \text{ cm}^2
\]

\[
x^2 = 47.25 \text{ cm}^2
\]

So \(x = \sqrt{47.25} \text{ cm}

\[
x = 6.87 \text{ cm}
\]

Keep the accurate figure in the calculator memory.

The area of the triangle is \(\frac{1}{2} \times 6 \times 6.87 \text{ cm}^2\) (from the calculator memory), which is 20.6 cm\(^2\) (1 decimal place)
**Pythagoras’ theorem in three dimensions**

This section shows you how to solve problems in 3-D using Pythagoras’ theorem.

In your GCSE examinations, there may be questions which involve applying Pythagoras’ theorem in 3-D situations. Such questions are usually accompanied by clearly labelled diagrams, which will help you to identify the lengths needed for your solutions.
You deal with these 3-D problems in exactly the same way as 2-D problems.

- Identify the right-angled triangle you need.
- Redraw this triangle and label it with the given lengths and the length to be found, usually $x$ or $y$.
- From your diagram, decide whether it is the hypotenuse or one of the shorter sides which has to be found.
- Solve the problem, rounding off to a suitable degree of accuracy.

**Example 5**

What is the longest piece of straight wire that can be stored in this box measuring 30 cm by 15 cm by 20 cm?

The longest distance across this box is any one of the diagonals $AG$, $DF$, $CE$ or $HB$.

Let us take $AG$.

First, identify a right-angled triangle containing $AG$ and draw it.

This gives a triangle $AFG$, which contains two lengths you do not know, $AG$ and $AF$.

Let $AG = x$ and $AF = y$.

Next identify a right-angled triangle that contains the side $AF$ and draw it.

This gives a triangle $ABF$. You can now find $AF$.

By Pythagoras’ theorem

\[ y^2 = 30^2 + 15^2 \text{ cm}^2 \]
\[ y^2 = 1350 \text{ cm}^2 \] (there is no need to find $y$)

Now find $AG$ using triangle $AFG$.

By Pythagoras’ theorem

\[ x^2 = y^2 + 15^2 \text{ cm}^2 \]
\[ x^2 = 1300 + 225 = 1525 \text{ cm}^2 \]
So \[ x = 39.1 \text{ cm} \] (1 decimal place)

So, the longest straight wire that can be stored in the box is 39.1 cm.
Note that in any cuboid with sides $a$, $b$ and $c$, the length of a diagonal is given by

$$\sqrt{a^2 + b^2 + c^2}$$

A box measures 8 cm by 12 cm by 5 cm.

a Calculate the lengths of the following.

i AC  ii BG  iii BE

b Calculate the diagonal distance BH.

A garage is 5 m long, 3 m wide and 3 m high. Can a 7 m long pole be stored in it?

Spike, a spider, is at the corner S of the wedge shown in the diagram. Fred, a fly, is at the corner F of the same wedge.

a Calculate the two distances Spike would have to travel to get to Fred if she used the edges of the wedge.

b Calculate the distance Spike would have to travel across the face of the wedge to get directly to Fred.

Fred is now at the top of a baked-beans can and Spike is directly below him on the base of the can. To catch Fred by surprise, Spike takes a diagonal route round the can. How far does Spike travel?

A corridor is 3 m wide and turns through a right angle, as in the diagram.

a What is the longest pole that can be carried along the corridor horizontally?

b If the corridor is 3 m high, what is the longest pole that can be carried along in any direction?
The diagram shows a square-based pyramid with base length 8 cm and sloping edges 9 cm. M is the mid-point of the side AB, X is the mid-point of the base, and E is directly above X.

a Calculate the length of the diagonal AC.

b Calculate EX, the height of the pyramid.

c Using triangle ABE, calculate the length EM.

The diagram shows a cuboid with sides of 40 cm, 30 cm, and 22.5 cm. M is the mid-point of the side FG. Calculate (or write down) these lengths, giving your answers to three significant figures if necessary.

a AH  b AG  c AM  d HM

Trigonometric ratios

In this section you will learn how to:

● use the three trigonometric ratios

Key words

adjacent side cosine hypotenuse opposite side sine tangent trigonometry

Trigonometry is concerned with the calculation of sides and angles in triangles, and involves the use of three important ratios: sine, cosine and tangent. These ratios are defined in terms of the sides of a right-angled triangle and an angle. The angle is often written as $\theta$.

In a right-angled triangle

● the side opposite the right angle is called the hypotenuse and is the longest side

● the side opposite the angle $\theta$ is called the opposite side
• the other side next to both the right angle and the angle \( \theta \) is called the adjacent side.

The sine, cosine and tangent ratios for \( \theta \) are defined as

\[
\text{sine } \theta = \frac{\text{Opposite}}{\text{Hypotenuse}} \quad \text{cosine } \theta = \frac{\text{Adjacent}}{\text{Hypotenuse}} \quad \text{tangent } \theta = \frac{\text{Opposite}}{\text{Adjacent}}
\]

These ratios are usually abbreviated as

\[
\sin \theta = \frac{O}{H} \quad \cos \theta = \frac{A}{H} \quad \tan \theta = \frac{O}{A}
\]

These abbreviated forms are also used on calculator keys.

Memorising these formulae may be helped by a mnemonic such as

Silly Old Hitler Couldn’t Advance His Troops Over Africa

in which the first letter of each word is taken in order to give

\[
S = \frac{O}{H} \quad C = \frac{A}{H} \quad T = \frac{O}{A}
\]

**Using your calculator**

You can use your calculator to find the sine, cosine and tangent of any angle.

To find the sine of an angle, press the key labelled \( \sin \).

To find the cosine of an angle, press the key labelled \( \cos \).

To find the tangent of an angle, press the key labelled \( \tan \).

Make sure you can find sin, cos and tan on your calculator.

**Important:** Make sure your calculator is working in degrees. Depending on the type of calculator used, you need to put it into *degree mode* before you start working on sines, cosines and tangents. This can be done either

* by using the \( \Box \deg \) button

* or by pressing the key \( \Box \text{DRG} \) until DEG is on display.

Try this now to make sure you can do it. When it is in degree mode, D or DEG appears on the calculator display.
Find these values, rounding off your answers to three significant figures.

1. \( a \) \( \sin 43^\circ \) \quad \( b \) \( \sin 56^\circ \) \quad \( c \) \( \sin 67.2^\circ \) \quad \( d \) \( \sin 90^\circ \)
   \( e \) \( \sin 45^\circ \) \quad \( f \) \( \sin 20^\circ \) \quad \( g \) \( \sin 22^\circ \) \quad \( h \) \( \sin 0^\circ \)

2. \( a \) \( \cos 43^\circ \) \quad \( b \) \( \cos 56^\circ \) \quad \( c \) \( \cos 67.2^\circ \) \quad \( d \) \( \cos 90^\circ \)
   \( e \) \( \cos 45^\circ \) \quad \( f \) \( \cos 20^\circ \) \quad \( g \) \( \cos 22^\circ \) \quad \( h \) \( \cos 0^\circ \)

3. From your answers to questions 1 and 2, what angle has the same value for sine and cosine?
a i  What is sin 35°?
ii  What is cos 55°?
b i  What is sin 12°?
ii  What is cos 78°?
c i  What is cos 67°?
ii  What is sin 23°?
d  What connects the values in parts a, b and c?
e  Copy and complete these sentences.
i  sin 15° is the same as cos …
ii  cos 82° is the same as sin …
iii  sin x is the same as cos …

Use your calculator to work out the values of

a  tan 43°  b  tan 56°  c  tan 67.2°  d  tan 90°
e  tan 45°  f  tan 20°  g  tan 22°  h  tan 0°

Use your calculator to work out the values of the following.

a  sin 73°  b  cos 26°  c  tan 65.2°  d  sin 88°
e  cos 35°  f  tan 30°  g  sin 28°  h  cos 5°

What is so different about tan compared with both sin and cos?

Use your calculator to work out the values of the following.

a  5 sin 65°  b  6 cos 42°  c  6 sin 90°  d  5 sin 0°

Use your calculator to work out the values of the following.

a  5 tan 65°  b  6 tan 42°  c  6 tan 90°  d  5 tan 0°

Use your calculator to work out the values of the following.

a  4 sin 63°  b  7 tan 52°  c  5 tan 80°  d  9 cos 8°

Use your calculator to work out the values of the following.

a  \( \frac{5}{\sin 63°} \)  b  \( \frac{6}{\cos 32°} \)  c  \( \frac{6}{\sin 90°} \)  d  \( \frac{5}{\sin 30°} \)

Use your calculator to work out the values of the following.

a  \( \frac{3}{\tan 64°} \)  b  \( \frac{7}{\tan 42°} \)  c  \( \frac{5}{\tan 89°} \)  d  \( \frac{6}{\tan 40°} \)

Use your calculator to work out the values of the following.

a  8 sin 75°  b  \( \frac{19}{\sin 23°} \)  c  7 cos 71°  d  \( \frac{15}{\sin 81°} \)
Use your calculator to work out the values of the following.

\[ a \ 8 \tan 75^\circ \]
\[ b \ \frac{19}{\tan 23^\circ} \]
\[ c \ 7 \tan 71^\circ \]
\[ d \ \frac{15}{\tan 81^\circ} \]

Using the following triangles calculate \( \sin x \), \( \cos x \), and \( \tan x \). Leave your answers as fractions.

The sine of 54° is 0.8090169944 (to 10 decimal places).

The sine of 55° is 0.8191520443 (to 10 decimal places).

What angle has a sine of 0.815?

Obviously, it is between 54° and 55°, so we could probably use a trial-and-improvement method to find it. But there is an easier way which uses the inverse functions on your calculator.

An inverse function can be accessed in several different ways. For example, the inverse function for sine may be any of these keys:

\[ \sin^{-1} \]
\[ \sin^{-1} \]
\[ \sin^{-1} \]
\[ \sin^{-1} \]

The inverse function printed above the sine key is usually given in either of the following ways:

\[ \sin^{-1} \]
\[ \arcsin \]
\[ \arcsin \]
\[ \arcsin \]

You will need to find out how your calculator deals with inverse functions.

When you do the inverse sine of 0.815, you should get 54.58736189°.

It is normal in trigonometry to round off angles to one decimal place. So, the angle with a sine of 0.815 is 54.6° (1 decimal place).

This can be written as \( \sin^{-1} 0.815 = 54.6^\circ \).
Use your calculator to find the answers to the following. Give your answers to one decimal place.

1. What angles have the following sines?
   a 0.5    b 0.785    c 0.64    d 0.877    e 0.999    f 0.707

2. What angles have the following cosines?
   a 0.5    b 0.64    c 0.999    d 0.707    e 0.2    f 0.7

3. What angles have the following tangents?
   a 0.6    b 0.38    c 0.895    d 1.05    e 2.67    f 4.38

4. What angles have the following sines?
   a 4 ÷ 5    b 2 ÷ 3    c 7 ÷ 10    d 5 ÷ 6    e 1 ÷ 24    f 5 ÷ 13

5. What angles have the following cosines?
   a 4 ÷ 5    b 2 ÷ 3    c 7 ÷ 10    d 5 ÷ 6    e 1 ÷ 24    f 5 ÷ 13

6. What angles have the following tangents?
   a 3 ÷ 5    b 7 ÷ 9    c 2 ÷ 7    d 9 ÷ 5    e 11 ÷ 7    f 6 ÷ 5
What happens when you try to find the angle with a sine of 1.2? What is the largest value of sine you can put into your calculator without getting an error when you ask for the inverse sine? What is the smallest?

a i What angle has a sine of 0.3? (Keep the answer in your calculator memory.)
ii What angle has a cosine of 0.3?
iii Add the two accurate answers of parts i and ii together.

b Will you always get the same answer to the above no matter what number you start with?

Using the sine function

In this section you will learn how to:
- find lengths of sides and angles in right-angled triangles using the sine function

Key word: sine

Remember sine \( \theta \) = \( \frac{\text{Opposite}}{\text{Hypotenuse}} \)

We can use the sine ratio to calculate the lengths of sides and angles in right-angled triangles.

EXAMPLE 12

Find the angle \( \theta \), given that the opposite side is 7 cm and the hypotenuse is 10 cm.

Draw a diagram. (This is an essential step.)

From the information given, use sine.

\[
\sin \theta = \frac{\text{Opposite}}{\text{Hypotenuse}} = \frac{7}{10} = 0.7
\]

What angle has a sine of 0.7? To find out, use the inverse sine function on your calculator.

\[
\sin^{-1} 0.7 = 44.4^\circ \quad (1 \text{ decimal place})
\]
EXAMPLE 13

Find the length of the side marked $a$ in this triangle.

Side $a$ is the opposite side, with 12 cm as the hypotenuse, so use sine.

$$\sin \theta = \frac{O}{H}$$
$$\sin 35^\circ = \frac{a}{12}$$

So $a = 12 \sin 35^\circ = 6.88$ cm (3 significant figures)

EXAMPLE 14

Find the length of the hypotenuse, $h$, in this triangle.

Note that although the angle is in the other corner, the opposite side is again given. So use sine.

$$\sin \theta = \frac{O}{H}$$
$$\sin 52^\circ = \frac{8}{h}$$

So $h = \frac{8}{\sin 52^\circ} = 10.2$ cm (3 significant figures)

EXERCISE 6H

1. Find the angle marked $x$ in each of these triangles.
   - a. 10 cm, 3 cm
   - b. 8 cm, 3 cm
   - c. 15 cm

2. Find the side marked $x$ in each of these triangles.
   - a. 13 cm, $24^\circ$
   - b. 8 cm, $46^\circ$
   - c. 32°, 25 cm

3. Find the side marked $x$ in each of these triangles.
   - a. $41^\circ$, 3 cm
   - b. $61^\circ$, 6 cm
   - c. $36^\circ$, 59 cm
CHAPTER 6: PYTHAGORAS AND TRIGONOMETRY

4. Find the side marked \( x \) in each of these triangles.
   
   a. \( \theta = 47^\circ, \quad 7 \text{ cm} \)
   
   b. \( \theta = 35^\circ, \quad 8 \text{ cm} \)
   
   c. \( \theta = 64^\circ, \quad 13 \text{ cm} \)
   
   d. \( \theta = 75^\circ, \quad 15 \text{ cm} \)

5. Find the value of \( x \) in each of these triangles.
   
   a. \( 11 \text{ cm}, \quad 15 \text{ cm} \)
   
   b. \( 9 \text{ cm}, \quad x \)
   
   c. \( 17 \text{ cm}, \quad x \)
   
   d. \( 4 \text{ cm}, \quad x \)

6. Angle \( \theta \) has a sine of \( \frac{3}{5} \). Calculate the missing lengths in these triangles.
   
   a. \( \theta = 37^\circ \)
   
   b. \( \theta = 50^\circ \)

Using the cosine function

In this section you will learn how to:
- find lengths of sides and angles in right-angled triangles using the cosine function

Key word

\[ \text{cosine} \]

Remember cosine \( \theta = \frac{\text{Adjacent}}{\text{Hypotenuse}} \)

We can use the cosine ratio to calculate the lengths of sides and angles in right-angled triangles.
EXAMPLE 15

Find the angle \( \theta \), given that the adjacent side is 5 cm and the hypotenuse is 12 cm.

Draw a diagram. (This is an essential step.)

From the information given, use cosine.

\[
\cos \theta = \frac{A}{H} = \frac{5}{12}
\]

What angle has a cosine of \( \frac{5}{12} \)? To find out, use the inverse cosine function on your calculator.

\[
\cos^{-1} = 65.4^\circ \text{ (1 decimal place)}
\]

EXAMPLE 16

Find the length of the side marked \( a \) in this triangle.

Side \( a \) is the adjacent side, with 9 cm as the hypotenuse, so use cosine.

\[
\cos \theta = \frac{A}{H}
\]

\[
\cos 47^\circ = \frac{a}{9}
\]

So \( a = 9 \cos 47^\circ = 6.14 \text{ cm} \text{ (3 significant figures)} \)

EXAMPLE 17

Find the length of the hypotenuse, \( h \), in this triangle.

The adjacent side is given. So use cosine.

\[
\cos \theta = \frac{A}{H}
\]

\[
\cos 40^\circ = \frac{20}{h}
\]

So \( h = \frac{20}{\cos 40^\circ} = 26.1 \text{ cm} \text{ (3 significant figures)} \)
Find the angle marked $x$ in each of these triangles.

Find the side marked $x$ in each of these triangles.

Find the side marked $x$ in each of these triangles.

Find the side marked $x$ in each of these triangles.

Find the value of $x$ in each of these triangles.

Angle $\theta$ has a cosine of $\frac{5}{13}$. Calculate the missing lengths in these triangles.
6.8 Using the tangent function

In this section you will learn how to:
- find lengths of sides and angles in right-angled triangles using the tangent function

Key word: tangent

Remember tangent \( \theta = \frac{\text{Opposite}}{\text{Adjacent}} \)

We can use the tangent ratio to calculate the lengths of sides and angles in right-angled triangles.

**EXAMPLE 18**

Find the angle \( \theta \), given that the opposite side is 3 cm and the adjacent side is 4 cm.

Draw a diagram. (This is an essential step.)

From the information given, use tangent.

\[
\tan \theta = \frac{O}{A} = \frac{3}{4} = 0.75
\]

What angle has a tangent of 0.75? To find out, use the inverse tangent function on your calculator.

\[\tan^{-1} 0.75 = 36.9^\circ \text{ (1 decimal place)}\]

**EXAMPLE 19**

Find the length of the side marked \( x \) in this triangle.

Side \( x \) is the opposite side, with 9 cm as the adjacent side, so use tangent.

\[
\tan \theta = \frac{O}{A}
\]

\[
\tan 62^\circ = \frac{x}{9}
\]

So, \( x = 9 \tan 62^\circ = 16.9 \text{ cm (3 significant figures)} \)
CHAPTER 6: PYTHAGORAS AND TRIGONOMETRY

EXAMPLE 20

Find the length of the side marked $a$ in this triangle.

Side $a$ is the adjacent side and the opposite side is given.

So use tangent.

\[
\tan \theta = \frac{O}{A} \\
\tan 35^\circ = \frac{6}{a} \\
So \ a = \frac{6}{\tan 35^\circ} = 8.57 \text{ cm} \quad (3 \text{ significant figures})
\]

EXERCISE 6J

1. Find the angle marked $x$ in each of these triangles.

2. Find the side marked $x$ in each of these triangles.

3. Find the side marked $x$ in each of these triangles.

4. Find the side marked $x$ in each of these triangles.
Find the value $x$ in each of these triangles.

Angle $\theta$ has a tangent of $\frac{4}{3}$. Calculate the missing lengths in these triangles.

**Which ratio to use**

In this section you will learn how to:
- decide which trigonometric ratio to use in a right-angled triangle

**Key words**
- sine
- cosine
- tangent

The difficulty with any trigonometric problem is knowing which ratio to use to solve it.

The following examples show you how to determine which ratio you need in any given situation.

**EXAMPLE 21**

Find the length of the side marked $x$ in this triangle.

**Step 1** Identify what information is given and what needs to be found. Namely, $x$ is opposite the angle and $16$ cm is the hypotenuse.

**Step 2** Decide which ratio to use. Only one ratio uses opposite and hypotenuse: sine.

**Step 3** Remember $\sin \theta = \frac{O}{H}$

**Step 4** Put in the numbers and letters: $\sin 37^\circ = \frac{x}{16}$

**Step 5** Rearrange the equation and work out the answer: $x = 16 \sin 37^\circ = 9.629040371$ cm

**Step 6** Give the answer to an appropriate degree of accuracy: $x = 9.63$ cm (3 significant figures)
In reality, you do not write down every step as in Example 21. Step 1 can be done by marking the triangle. Steps 2 and 3 can be done in your head. Steps 4 to 6 are what you write down.

Remember that examiners will want to see evidence of working. Any reasonable attempt at identifying the sides and using a ratio will probably get you some method marks – but only if the fraction is the right way round.

The next examples are set out in a way that requires the minimum amount of working but gets maximum marks.

**EXAMPLE 22**

Find the length of the side marked $x$ in this triangle.

Mark on the triangle the side you know (H) and the side you want to find (A).

Recognise it is a \textit{cosine} problem because you have A and H.

So \[\cos 50^\circ = \frac{x}{7}\]

\[x = 7 \cos 50^\circ = 4.50 \text{ cm (3 significant figures)}\]

**EXAMPLE 23**

Find the angle marked $x$ in this triangle.

Mark on the triangle the sides you know.

Recognise it is a \textit{sine} problem because you have O and H.

So \[\sin x = \frac{9}{15} = 0.6\]

\[x = \sin^{-1} 0.6 = 36.9^\circ \text{ (1 decimal place)}\]
EXAMPLE 24

Find the angle marked $x$ in this triangle.

Mark on the triangle the sides you know.
Recognise it is a tangent problem because you have O and A.
So $\tan x = \frac{12}{7}$
$x = \tan^{-1} \frac{12}{7} = 59.7^\circ$ (1 decimal place)

EXERCISE 6K → ANSWERS

1. Find the length marked $x$ in each of these triangles.

a  
\[
\begin{array}{c}
20 \\
39^\circ \\
\end{array}
\]

b  
\[
\begin{array}{c}
40^\circ \\
50 \\
\end{array}
\]

c  
\[
\begin{array}{c}
48^\circ \\
50 \\
\end{array}
\]

d  
\[
\begin{array}{c}
20 \\
37^\circ \\
\end{array}
\]

e  
\[
\begin{array}{c}
40^\circ \\
52 \\
\end{array}
\]

f  
\[
\begin{array}{c}
76^\circ \\
5 \\
\end{array}
\]

2. Find the angle marked $x$ in each of these triangles.

a  
\[
\begin{array}{c}
20 \\
14 \\
\end{array}
\]

b  
\[
\begin{array}{c}
60 \\
50 \\
\end{array}
\]

c  
\[
\begin{array}{c}
70 \\
50 \\
\end{array}
\]

d  
\[
\begin{array}{c}
20 \\
13 \\
\end{array}
\]

e  
\[
\begin{array}{c}
100 \\
52 \\
\end{array}
\]

f  
\[
\begin{array}{c}
4 \\
5 \\
\end{array}
\]

Find the angle or length marked $x$ in each of these triangles.

In a maths textbook it says:

The tangent of any angle is equal to the sine of the angle divided by the cosine of the angle.

a Show clearly that this is true for an angle of 30°.

b Prove, by using the definitions of $\sin \theta$ and $\cos \theta$, that the statement is true for this right-angled triangle.
Solving problems using trigonometry

In this section you will learn how to:
- solve practical problems using trigonometry
- solve problems using an angle of elevation or an angle of depression
- solve bearing problems using trigonometry
- using trigonometry to solve problems involving isosceles triangles

Key words
- angle of depression
- angle of elevation
- bearing
- isosceles triangle
- three-figure bearing
- trigonometry

Most trigonometry problems in GCSE examination papers do not come as straightforward triangles. Usually, solving a triangle is part of solving a practical problem. You should follow these steps when solving a practical problem using trigonometry.

- Draw the triangle required.
- Put on the information given (angles and sides).
- Put on \( x \) for the unknown angle or side.
- Mark on two of \( O \), \( A \) or \( H \) as appropriate.
- Choose which ratio to use.
- Write out the equation with the numbers in.
- Rearrange the equation if necessary, then work out the answer.
- Give your answer to a sensible degree of accuracy. Answers given to three significant figures or to the nearest degree are acceptable in exams.

**EXAMPLE 25**

A window cleaner has a ladder which is 7 m long. The window cleaner leans it against a wall so that the foot of the ladder is 3 m from the wall. What angle does the ladder make with the wall?

Draw the situation as a right-angled triangle.

Then mark the sides and angle.

Recognise it is a sine problem because you have \( O \) and \( H \).

So \( \sin x = \frac{3}{7} \)

\[ x = \sin^{-1} \left( \frac{3}{7} \right) = 25^\circ \text{ (to the nearest degree)} \]
In these questions, give answers involving angles to the nearest degree.

1. A ladder, 6 m long, rests against a wall. The foot of the ladder is 2.5 m from the base of the wall. What angle does the ladder make with the ground?

2. The ladder in question 1 has a “safe angle” with the ground of between 60° and 70°. What are the safe limits for the distance of the foot of the ladder from the wall?

3. Another ladder, of length 10 m, is placed so that it reaches 7 m up the wall. What angle does it make with the ground?

4. Yet another ladder is placed so that it makes an angle of 76° with the ground. When the foot of the ladder is 1.7 m from the foot of the wall, how high up the wall does the ladder reach?

5. Calculate the angle that the diagonal makes with the long side of a rectangle which measures 10 cm by 6 cm.

6. This diagram shows a frame for a bookcase.
   a. What angle does the diagonal strut make with the long side?
   b. Use Pythagoras’ theorem to calculate the length of the strut.

7. This diagram shows a roof truss.
   a. What angle will the roof make with the horizontal?
   b. Use Pythagoras’ theorem to calculate the length of the sloping strut.

8. Alicia paces out 100 m from the base of a church. She then measures the angle to the top of the spire as 23°. How high is the church spire?

9. A girl is flying a kite on a string 32 m long. The string, which is being held at 1 m above the ground, makes an angle of 39° with the horizontal. How high is the kite above the ground?
Angle $\theta$ has a sine of $\frac{3}{5}$.

a. Use Pythagoras’ theorem to calculate the missing side of this triangle.
b. Write down the cosine and the tangent of $\theta$.
c. Calculate the missing lengths marked $x$ in these triangles.

Angles of elevation and depression

When you look up at an aircraft in the sky, the angle through which your line of sight turns from looking straight ahead (the horizontal) is called the angle of elevation.

When you are standing on a high point and look down at a boat, the angle through which your line of sight turns from looking straight ahead (the horizontal) is called the angle of depression.

Example 26

From the top of a vertical cliff, 100 m high, Andrew sees a boat out at sea. The angle of depression from Andrew to the boat is 42°. How far from the base of the cliff is the boat?

The diagram of the situation is shown in figure i.

From this, you get the triangle shown in figure ii.

From figure ii, you see that this is a tangent problem.

So $\tan 42^\circ = \frac{100}{x}$

$x = \frac{100}{\tan 42^\circ} = 111 \text{ m (3 significant figures)}$
In these questions, give any answers involving angles to the nearest degree.

1. Eric sees an aircraft in the sky. The aircraft is at a horizontal distance of 25 km from Eric. The angle of elevation is 22°. How high is the aircraft?

2. A passenger in an aircraft hears the pilot say that they are flying at an altitude of 4000 m and are 10 km from the airport. If the passenger can see the airport, what is the angle of depression?

3. A man standing 200 m from the base of a television transmitter looks at the top of it and notices that the angle of elevation of the top is 65°. How high is the tower?

4. From the top of a vertical cliff, 200 m high, a boat has an angle of depression of 52°. How far from the base of the cliff is the boat?

5. From a boat, the angle of elevation of the foot of a lighthouse on the edge of a cliff is 34°.
   a. If the cliff is 150 m high, how far from the base of the cliff is the boat?
   b. If the lighthouse is 50 m high, what would be the angle of elevation of the top of the lighthouse from the boat?

6. A bird flies from the top of a 12 m tall tree, at an angle of depression of 34°, to catch a worm on the ground.
   a. How far does the bird actually fly?
   b. How far was the worm from the base of the tree?

7. Sunil stands about 50 m away from a building. The angle of elevation from Sunil to the top of the building is about 15°. How tall is the building?

8. The top of a ski run is 100 m above the finishing line. The run is 300 m long. What is the angle of depression of the ski run?

Trigonometry and bearings

A bearing is the direction to one place from another. The usual way of giving a bearing is as an angle measured from north in a clockwise direction. This is how a navigational compass and a surveyor's compass measure bearings.

A bearing is always written as a three-digit number, known as a three-figure bearing.

The diagram shows how this works, using the main compass points as examples.

When working with bearings, follow these three rules.

- Always start from north.
- Always measure clockwise.
- Always give a bearing in degrees and as a three-figure bearing.
The difficulty with trigonometric problems involving bearings is dealing with those angles greater than 90° whose trigonometric ratios have negative values. To avoid this, we have to find a right-angled triangle that we can readily use. Example 27 shows you how to deal with such a situation.

**EXAMPLE 27**

A ship sails on a bearing of 120° for 50 km.

How far east has it travelled?

The diagram of the situation is shown in figure i.

From this, you can get the acute-angled triangle shown in figure ii.

From figure ii, you see that this is a cosine problem.

So \( \cos 30° = \frac{x}{50} \)

\[ x = 50 \cos 30° = 43.301 = 43.3 \text{ km} \] (3 significant figures)

**EXERCISE 6N**

1. A ship sails for 75 km on a bearing of 078°.
   - How far east has it travelled?
   - How far north has it travelled?

2. Lopham is 17 miles from Wath on a bearing of 210°.
   - How far south of Wath is Lopham?
   - How far east of Lopham is Wath?

3. A plane sets off from an airport and flies due east for 120 km, then turns to fly due south for 70 km before landing at Seddeth. What is the bearing of Seddeth from the airport?

4. A helicopter leaves an army base and flies 60 km on a bearing of 278°.
   - How far west has the helicopter flown?
   - How far north has the helicopter flown?

5. A ship sails from a port on a bearing of 117° for 35 km before heading due north for 40 km and docking at Angle Bay.
   - How far south had the ship sailed before turning?
   - How far north had the ship sailed from the port to Angle Bay?
   - How far east is Angle Bay from the port?
   - What is the bearing from the port to Angle Bay?

6. Mountain A is due west of a walker. Mountain B is due north of the walker. The guidebook says that mountain B is 4.3 km from mountain A, on a bearing of 058°. How far is the walker from mountain B?
The diagram shows the relative distances and bearings of three ships A, B and C.

a How far north of A is B? (Distance x on diagram.)

b How far north of B is C? (Distance y on diagram.)

c How far west of A is C? (Distance z on diagram.)

d What is the bearing of A from C? (Angle w° on diagram.)

A ship sails from port A for 42 km on a bearing of 130° to point B. It then changes course and sails for 24 km on a bearing of 040° to point C, where it breaks down and anchors. What distance and on what bearing will a helicopter have to fly from port A to go directly to the ship at C?

Trigonometry and isosceles triangles

Isosceles triangles often feature in trigonometry problems because such a triangle can be split into two right-angled triangles that are congruent.

**EXAMPLE 28**

a Find the length x in this isosceles triangle.

b Calculate the area of the triangle.

Draw a perpendicular from the apex of the triangle to its base, splitting the triangle into two congruent, right-angled triangles.

a To find the length y, which is \( \frac{1}{2} \) of x, use cosine.

So, \( \cos 53° = \frac{y}{7} \)

\[ y = 7 \cos 53° = 4.2127051 \text{ cm} \]

So the length \( x = 2y = 8.43 \text{ cm} \) (3 significant figures).
In questions 1–4, find the side or angle marked \( x \).

This diagram below shows a roof truss. How wide is the roof?

Calculate the area of each of these triangles.

\( \text{Area of triangle } a = \frac{1}{2} \times 9 \times 18 \) and the angle is 34°.

\( \text{Area of triangle } b = \frac{1}{2} \times 14 \times 24 \) and the angle is 84°.

\( \text{Area of triangle } c = \frac{1}{2} \times 18 \times 14 \) and the angle is 18 cm.

\( \text{Area of triangle } d = \frac{1}{2} \times 24 \times 84 \) and the angle is 18 cm.
A football pitch ABCD is shown. The length of the
pitch, AB = 120 m. The width of the pitch, BC = 90 m.

(a) Calculate the length of the diagonal BD.
Give your answer to 1 decimal place.

(b) A ladder is leant against a wall. Its foot is 0.8 m from
the wall and it reaches to a height of 4 m up the wall.

Calculate the length, in metres, of the ladder
marked x on the diagram. Give your answer to a
suitable degree of accuracy.

In the diagram, ABC is a right-angled triangle.
AC = 18 cm and AB = 12 cm.

(a) Calculate the length of BC.

(b) In the diagram, ABC is a right angled triangle. AB = 12 cm,
BC = 8 cm. Find the size of angle CAB (marked x in
the diagram). Give your answer to 1 decimal place.

(a) ABC is a right angled triangle. AB = 12 cm,
BC = 8 cm. Find the size of angle CAB (marked x in
the diagram). Give your answer to 1 decimal place.

(b) PQR is a right-angled triangle. PQ = 15 cm,
angle QPR = 32°. Find the length of PR (marked y in
the diagram). Give your answer to 1 decimal place.

In the diagram, ABC is a right-angled triangle.
AC = 18 cm and AB = 12 cm.

(a) Calculate the length of DG. Give your answer
correct to 3 significant figures.

(b) Calculate the size of the angle marked x°.
Give your answer correct to 1 decimal place.

A lighthouse, L, is 3.2 km due West of a port, P.
A ship, S, is 1.9 km due North of the lighthouse, L.

(a) Calculate the size of the angle marked x. Give your
answer correct to 3 significant figures.

(b) Find the bearing of the port, P, from the ship, S.
Give your answer correct to 3 significant figures.
The diagram represents a cuboid ABCDEFGH.

a Calculate the length of AG. Give your answer correct to 3 significant figures.
b Calculate the size of the angle between AG and the face ABCD. Give your answer correct to 1 decimal place.

Edexcel, Question 15, Paper 6 Higher, November 2004

WORKED EXAM QUESTION

a ABC is a right-angled triangle. AC = 19 cm and AB = 9 cm. Calculate the length of BC.

Solution

Let BC = x
By Pythagoras’ theorem
\[ x^2 = 19^2 - 9^2 \text{ cm}^2 \]
\[ = 280 \text{ cm}^2 \]
So \[ x = \sqrt{280} = 16.7 \text{ cm (3 sf)} \]

b PQR is a right-angled triangle. PQ = 11 cm and QR = 24 cm. Calculate the size of angle PRQ.

Let \( \angle \ PRQ = \theta \)
So \( \tan \theta = \frac{11}{24} \)
\[ \theta = \tan^{-1} \frac{11}{24} = 24.6^\circ \text{ (1 dp)} \]

c ABD and BCD are right-angled triangles. AB = 26 cm, AD = 24 cm and angle BCD = 35º. Calculate the length of BC. Give your answer to 3 significant figures.

In triangle ABC, let BD = x
By Pythagoras’ theorem
\[ x^2 = 26^2 - 24^2 \]
\[ = 100 \]
\[ x = 10 \text{ cm} \]

In triangle BCD, let BC = y
So \( \sin 35^\circ = \frac{10}{y} \)
\[ y = \frac{10}{\sin 35^\circ} \]
So BC = 17.4 cm (3 sf)
GRADE YOURSELF

- Able to use Pythagoras' theorem in right-angled triangles
- Able to solve problems in 2-D using Pythagoras' theorem
- Able to solve problems in 3-D using Pythagoras' theorem
- Able to use trigonometry to find lengths of sides and angles in right-angled triangles
- Able to use trigonometry to solve problems

What you should know now

- How to use Pythagoras' theorem
- How to solve problems using Pythagoras' theorem
- How to use the trigonometric ratios for sine, cosine and tangent in right-angled triangles
- How to solve problems using trigonometry
- How to solve problems using angles of elevation, angles of depression and bearings
This chapter will show you ...

- how to find angles in triangles and quadrilaterals
- how to find interior and exterior angles in polygons
- how to find angles using circle theorems

What you should already know

- Vertically opposite angles are equal. The angles labelled $a$ and $b$ are vertically opposite angles.

- The angles on a straight line add up to 180°, so $a + b = 180°$. This is true for any number of angles on a line. For example, $c + d + e + f = 180°$

- The sum of the angles around a point is 360°. For example, $a + b + c + d + e = 360°$
The three interior angles of a triangle add up to 180°. So, \(a + b + c = 180°\)

The four interior angles of a quadrilateral add up to 360°. So, \(a + b + c + d = 360°\)

A line which cuts parallel lines is called a transversal. The equal angles so formed are called alternate angles.

Because of their positions, the angles shown above are called corresponding angles.

Two angles positioned like \(a\) and \(b\), which add up to 180°, are called allied angles.

A polygon is a 2-D shape with straight sides.

Circle terms

Quick check  ANSWERS

Find the marked angles in these diagrams.

1

\(55°\)

\(75°\)

2

\(70°\)

\(60°\)

3

\(65°\)
7.1 Special triangles and quadrilaterals

In this section you will learn how to:
- find angles in triangles and quadrilaterals

Key words
- equilateral triangle
- isosceles triangle
- kite
- parallelogram
- rhombus
- trapezium

Special triangles

An equilateral triangle is a triangle with all its sides equal.

Therefore, all three interior angles are 60°.

An isosceles triangle is a triangle with two equal sides, and therefore with two equal angles.

Notice how we mark the equal sides and equal angles.

EXAMPLE 1

Find the angle marked \(a\) in the triangle.

The triangle is isosceles, so both base angles are 70°.

So \(a = 180° - 70° - 70° = 40°\)
**Special quadrilaterals**

A **trapezium** has two parallel sides.

The sum of the interior angles at the ends of each non-parallel side is $180^\circ$: that is, $\angle A + \angle D = 180^\circ$ and $\angle B + \angle C = 180^\circ$.

A **parallelogram** has opposite sides parallel.

Its opposite sides are equal. Its diagonals bisect each other. Its opposite angles are equal: that is, $\angle A = \angle C$ and $\angle B = \angle D$.

A **rhombus** is a parallelogram with all its sides equal.

Its diagonals bisect each other at right angles. Its diagonals also bisect the angles at the vertices.

A **kite** is a quadrilateral with two pairs of equal adjacent sides.

Its longer diagonal bisects its shorter diagonal at right angles. The opposite angles between the sides of different lengths are equal.

---

**EXAMPLE 2**

Find the angles marked $x$ and $y$ in this parallelogram.

$x = 55^\circ$ (opposite angles are equal) and $y = 125^\circ$ ($x + y = 180^\circ$)

---

**EXERCISE 7A**

1. Calculate the lettered angles in each triangle.
An isosceles triangle has an angle of 50°. Sketch the two different possible triangles that match this description, showing what each angle is.

Find the missing angles in these quadrilaterals.

The three angles of an isosceles triangle are \(2x, x - 10\) and \(x - 10\). What is the actual size of each angle?

Calculate the lettered angles in these diagrams.

Calculate the values of \(x\) and \(y\) in each of these quadrilaterals.

Find the value of \(x\) in each of these quadrilaterals and hence state the type of quadrilateral it is.

- **a** a quadrilateral with angles \(x + 10, x + 20, 2x + 20, 2x + 10\)
- **b** a quadrilateral with angles \(x - 10, 2x + 10, x - 10, 2x + 10\)
- **c** a quadrilateral with angles \(x - 10, 2x, 5x - 10, 5x - 10\)
- **d** a quadrilateral with angles \(4x + 10, 5x - 10, 3x + 30, 2x + 50\)
A **polygon** has two kinds of angle.

- **Interior angles** are angles made by adjacent sides of the polygon and lying inside the polygon.
- **Exterior angles** are angles lying on the outside of the polygon, so that the interior angle + the exterior angle = 180°.

The **exterior angles** of any polygon add up to 360°.

**Interior angles**

You can find the sum of the interior angles of any polygon by splitting it into triangles.
Since we already know that the angles in a triangle add up to 180°, the sum of the interior angles in a polygon is found by multiplying the number of triangles in the polygon by 180°, as shown in this table.

As you can see from the table, for an $n$-sided polygon, the sum of the interior angles, $S$, is given by the formula

$$S = 180(n - 2)°$$

**Exterior angles**

As you see from the diagram, the sum of an exterior angle and its adjacent interior angle is 180°.

**Regular polygons**

A polygon is regular if all its interior angles are equal and all its sides have the same length. This means that all the exterior angles are also equal.

All regular polygons can be drawn by dividing the circumference of a circle into equal divisions, which means that the angle at the centre of a regular polygon is $\frac{360°}{n}$

Here are two simple formulae for calculating the interior and the exterior angles of regular polygons.

- The exterior angle, $E$, of a regular $n$-sided polygon is $E = \frac{360°}{n}$

- The interior angle, $I$, of a regular $n$-sided polygon is $I = 180° - E = 180° - \frac{360°}{n}$

**EXAMPLE 3**

Find the exterior angle, $x$, and the interior angle, $y$, for this regular octagon.

$$x = \frac{360°}{8} = 45° \text{ and } y = 180° - 45° = 135°$$
Calculate the sum of the interior angles of polygons with these numbers of sides.

a 10 sides  

b 15 sides  

c 100 sides  

d 45 sides  

Calculate the size of the interior angle of regular polygons with these numbers of sides.

a 12 sides  

b 20 sides  

c 9 sides  

d 60 sides  

Find the number of sides of polygons with these interior angle sums.

a 1260°  

b 2340°  

c 18 000°  

d 8640°  

Find the number of sides of regular polygons with these exterior angles.

a 24°  

b 10°  

c 15°  

d 5°  

Find the number of sides of regular polygons with these interior angles.

a 150°  

b 140°  

c 162°  

d 171°  

Calculate the size of the unknown angle in each of these polygons.

Find the value of \( x \) in each of these polygons.

What is the name of the regular polygon whose interior angles are twice its exterior angles?

Wesley measured all the interior angles in a polygon. He added them up to make 991°, but he had missed out one angle.

a What type of polygon did Wesley measure?

b What is the size of the missing angle?
In the triangle ABC, angle A is 42°, angle B is 67°.

i Calculate the value of angle C.

ii What is the value of the exterior angle at C.

iii What connects the exterior angle at C with the sum of the angles at A and B?

b Prove that any exterior angle of a triangle is equal to the sum of the two opposite interior angles.

Circle theorems

In this section you will learn how to:

- find angles in circles

Key words

- arc
- circle
- circumference
- diameter
- segment
- semicircle
- subtended

Here are three circle theorems you need to know.

- **Circle theorem 1**
  The angle at the centre of a circle is twice the angle at the circumference subtended by the same arc.
  \[ \angle AOB = 2 \times \angle ACB \]

- **Circle theorem 2**
  Every angle at the circumference of a semicircle that is subtended by the diameter of the semicircle is a right angle.

- **Circle theorem 3**
  Angles at the circumference in the same segment of a circle are equal.
  Points C₁, C₂, C₃, and C₄ on the circumference are subtended by the same arc AB.
  So \( \angle AC₁B = \angle AC₂B = \angle AC₃B = \angle AC₄B \)

Follow through Examples 4–6 to see how these theorems are applied.
CHAPTER 7: GEOMETRY

EXAMPLE 4

O is the centre of each circle. Find the angles marked \(a\) and \(b\) in each circle.

i

\[a = 35^\circ\] (angles in same segment)

\[b = 2 \times 35^\circ\] (angle at centre = twice angle at circumference)

\[= 70^\circ\]

ii

With \(OP = OQ\), triangle \(OPQ\) is isosceles and the sum of the angles in this triangle = 180°

So

\[a + (2 \times 25^\circ) = 180^\circ\]

\[a = 180^\circ - (2 \times 25^\circ)\]

\[= 130^\circ\]

\[b = 130^\circ \div 2\] (angle at centre = twice angle at circumference)

\[= 65^\circ\]

EXAMPLE 5

O is the centre of the circle. PQR is a straight line.

Find the angle labelled \(a\).

\[\angle PQT = 180^\circ - 72^\circ = 108^\circ\] (angles on straight line)

The reflex angle \(\angle POT = 2 \times 108^\circ\) (angle at centre = twice angle at circumference)

\[= 216^\circ\]

\[a + 216^\circ = 360^\circ\] (sum of angles around a point)

\[a = 360^\circ - 216^\circ\]

\[a = 144^\circ\]
EXAMPLE 6

O is the centre of the circle. POQ is parallel to TR.

Find the angles labelled $a$ and $b$.

$a = 64° - 2$ (angle at centre = twice angle at circumference)

$a = 32°$

$\angle TQP = a$ (alternate angles)

$= 32°$

$\angle PTQ = 90°$ (angle in a semicircle)

$b + 90° + 32° = 180°$ (sum of angles in $\triangle PQT$)

$b = 180° - 122°$

$b = 58°$

EXERCISE 7C

1. Find the angle marked $x$ in each of these circles with centre O.

2. Find the angle marked $x$ in each of these circles with centre O.
In the diagram, O is the centre of the circle. Find these angles.

a $\angle ADB$

b $\angle DBA$

c $\angle CAD$

In the diagram, O is the centre of the circle. Find these angles.

a $\angle EDF$

b $\angle DEG$

c $\angle EGF$

Find the angles marked $x$ and $y$ in each of these circles. O is the centre where shown.

In the diagram, O is the centre and AD a diameter of the circle. Find $x$.

A, B, C and D are points on the circumference of a circle with centre O.

Angle ABO is $x^\circ$ and angle CBO is $y^\circ$.

a State the value of angle BAO.

b State the value of angle AOD

c Prove that the angle subtended by the chord AC at the centre of a circle is twice the angle subtended at the circumference.
In this section you will learn how to:

- find angles in cyclic quadrilaterals

**Key word**
cyclic quadrilateral

A quadrilateral whose four vertices lie on the circumference of a circle is called a **cyclic quadrilateral**.

- **Circle theorem 4**

  The sum of the opposite angles of a cyclic quadrilateral is $180^\circ$.

  
  
  
  \[
  a + c = 180^\circ \quad \text{and} \quad b + d = 180^\circ
  \]

**EXAMPLE 7**

Find the angles marked $x$ and $y$ in the diagram.

\[
x + 85^\circ = 180^\circ \quad \text{(angles in a cyclic quadrilateral)}
\]

So $x = 95^\circ$

\[
y + 108^\circ = 180^\circ \quad \text{(angles in a cyclic quadrilateral)}
\]

So $y = 72^\circ$

**EXERCISE 7D**

Find the sizes of the lettered angles in each of these circles.
Find the values of $x$ and $y$ in each of these circles. Where shown, O marks the centre of the circle.

1. a $x$ b $y$ c $x$ d $y$

2. a $x$ b $y$ c $x$ d $y$

3. a $x$ b $y$ c $x$ d $y$

4. a $x$ b $y$ c $x$ d $y$

5. a $x$ b $y$ c $x$ d $y$

6. The cyclic quadrilateral PQRT has $\angle ROQ$ equal to 38° where O is the centre of the circle. POT is a diameter and parallel to QR. Calculate these angles.

   a $\angle ROT$  b $\angle QRT$  c $\angle QPT$
ABCD is a cyclic quadrilateral within a circle centre O and \( \angle AOC \) is 2\( x \)°.

a) Write down the value of \( \angle ABC \).

b) Write down the value of the reflex angle AOC.

c) Prove that the sum of a pair of opposite angles of a cyclic quadrilateral is 180°.

### 7.5 Tangents and chords

In this section you will learn how to:

- find angles in circles when tangents or chords are used

**Key words**

chord

point of contact

radius
tangent

A **tangent** is a straight line that touches a circle at one point only. This point is called the **point of contact**. A **chord** is a line that joins two points on the circumference.

- **Circle theorem 5**

A tangent to a circle is perpendicular to the **radius** drawn to the point of contact.

The radius \( OX \) is perpendicular to the tangent \( AB \).

- **Circle theorem 6**

Tangents to a circle from an external point to the points of contact are equal in length.

\[ AX = AY \]

- **Circle theorem 7**

The line joining an external point to the centre of the circle bisects the angle between the tangents.

\[ \angle OAX = \angle OAY \]
• Circle theorem 8
  A radius bisects a chord at 90°.
  If \( \angle BMO = 90° \) and \( BM = CM \).

**EXAMPLE 8**

\( OA \) is the radius of the circle and \( AB \) is a tangent.

- \( OA = 5 \text{ cm} \) and \( AB = 12 \text{ cm} \).
- Calculate the length \( OB \).
- \( \angle OAB = 90° \) (radius is perpendicular to a tangent)
- Let \( OB = x \)
- By Pythagoras’ theorem
  \[ x^2 = 5^2 + 12^2 \text{ cm}^2 \]
  \[ x^2 = 169 \text{ cm}^2 \]
  So \( x = \sqrt{169} = 13 \text{ cm} \)

**EXERCISE 7E**

1. In each diagram, \( TP \) and \( TQ \) are tangents to a circle with centre \( O \). Find each value of \( x \).

   ![Diagram a](image1)
   ![Diagram b](image2)
   ![Diagram c](image3)
   ![Diagram d](image4)

2. Each diagram shows tangents to a circle with centre \( O \). Find each value of \( y \).

   ![Diagram a](image5)
   ![Diagram b](image6)
   ![Diagram c](image7)
   ![Diagram d](image8)

Each diagram shows a tangent to a circle with centre O. Find x and y in each case.

In each of the diagrams, TP and TQ are tangents to the circle with centre O. Find each value of x.

Two circles with the same centre have radii of 7 cm and 12 cm respectively. A tangent to the inner circle cuts the outer circle at A and B. Find the length of AB.

AB and CB are tangents from B to the circle with centre O. OA and OC are radii.

a Prove that angles AOB and COB are equal.

b Prove that OB bisects the angle ABC.
PTQ is the tangent to a circle at T. The segment containing $\angle TBA$ is known as the alternate segment of $\angle PTA$, because it is on the other side of the chord AT from $\angle PTA$.

- **Circle theorem 9**

  The angle between a tangent and a chord through the point of contact is equal to the angle in the alternate segment.

  $$\angle PTA = \angle TBA$$

**EXAMPLE 9**

In the diagram, find $a \angle ATS$ and $b \angle TSR$.

- $a \angle ATS = 80^\circ$ (angle in alternate segment)
- $b \angle TSR = 70^\circ$ (angle in alternate segment)

**EXERCISE 7F**

Find the size of each lettered angle.
In each diagram, find the size of each lettered angle.

a

b

c

d

In each diagram, find the value of $x$.

a

b

c

ATB is a tangent to each circle with centre O. Find the size of each lettered angle.

a

b

c

d

PT is a tangent to a circle with centre O. AB are points on the circumference. Angle PBA is $x^\circ$.

a Write down the value of angle AOP.

b Calculate the angle OPA in terms of $x$.

c Prove that the angle APT is equal to the angle PBA.
The diagram shows a regular pentagon.

Calculate the size of the exterior angle of the regular pentagon, marked x on the diagram.

The diagram shows part of a regular polygon.
Each interior angle is 150°.

Calculate the number of sides of the polygon.

A, B, C and D are points on a circle, centre O.
Angle BOD = 116°

a Calculate the size of angle BAD.
BC = CD.
b Calculate the size of angle DBC.

In the diagram, AOB is a diameter of the circle, centre O. TS is a tangent to the circle at C.
Angle ABC = 52°.

a Write down the size of angle ACB.
b Calculate the size of angle BCS.

R, S and T are points on the circumference of a circle, centre O. PS and PT are tangents to the circle. PSN and TORN are straight lines.
PO is parallel to SR.
SR = NR.
Angle OPT = angle OPS.

a Work out the size of angle PNT.
b Show that PS = SN.

In the diagram, A, B and C are points on the circumference of a circle, centre O. PA and PB are tangents to the circle. Angle ACB = 75°.

a i Work out the size of angle AOB.
ii Give a reason for your answer.
b Work out the size of angle APB.
WORKED EXAM QUESTIONS

1. Write down the value of $a$.
   Calculate the value of $b$.

2. A and C are points on the circumference of a circle centre O.
   AD and CD are tangents. Angle ADO = 40°.

   Explain why angle AOC is 130°.

3. ABCD is a cyclic quadrilateral.
   PAQ is a tangent to the circle at A.
   BC = CD.
   AD is parallel to BC.
   Angle BAQ = 42°.

   Explain why angle BAD is 84°.

Solutions

1. $a = 70°$ (angle in same segment)
   $b = 110°$ (opposite angles in cyclic quadrilateral = 180°)

2. $\angle OAD = 90°$ (radius is perpendicular to tangent)
   $\angle AOD = 65°$ (angles in a triangle)
   Similarly:
   $\angle OCD = 90°$ (radius is perpendicular to tangent)
   $\angle COD = 65°$ (angles in a triangle)
   So $\angle AOC = 130°$

3. $\angle ADB = 42°$ (alternate segment theorem)
   $\angle DBC = 42°$ (alternate angles in parallel lines)
   $\angle BDC = 42°$ (isosceles triangle)
   $\angle DCB = 96°$ (angles in a triangle)
   So $\angle BAD = 84°$ (opposite angles in cyclic quadrilateral = 180°)
GRADE YOURSELF

- Able to find angles in triangles and quadrilaterals
- Able to find interior angles and exterior angles in polygons
- Able to find angles in circles
- Able to find angles in circles using the alternate segment theorem
- Can use circle theorems to prove geometrical results

What you should know now

- How to find angles in any triangle or in any quadrilateral
- How to calculate interior and exterior angles in polygons
- How to use circle theorems to find angles
This chapter will show you ...  
● how to show that two triangles are congruent  
● what is meant by a transformation  
● how to translate, reflect, rotate and enlarge 2-D shapes

What you should already know  
● How to find the lines of symmetry of a 2-D shape  
● How to find the order of rotational symmetry of a 2-D shape  
● How to recognise congruent shapes  
● How to draw the lines with equations \( y = x \) and \( y = -x \), and lines with equations like \( x = 2 \) and \( y = 3 \)

Quick check  
Which of these shapes is not congruent to the others?

\[ \text{a} \quad \text{b} \quad \text{c} \quad \text{d} \]
Two shapes are **congruent** if they are exactly the same size and shape.

For example, these triangles are all congruent.

Notice that the triangles can be differently orientated (reflected or rotated).

**Conditions for congruent triangles**

Any one of the following four conditions is sufficient for two triangles to be congruent.

- **Condition 1**
  All three sides of one triangle are equal to the corresponding sides of the other triangle.

  ![Condition 1 example](image)

  This condition is known as SSS (side, side, side).

- **Condition 2**
  Two sides and the angle between them of one triangle are equal to the corresponding sides and angle of the other triangle.

  ![Condition 2 example](image)

  This condition is known as SAS (side, angle, side).
• **Condition 3**

Two angles and a side of one triangle are equal to the corresponding angles and side of the other triangle.

This condition is known as ASA (angle, side, angle) or AAS (angle, angle, side).

• **Condition 4**

Both triangles have a right angle, an equal hypotenuse and another equal side.

This condition is known as RHS (right angle, hypotenuse, side).

**Notation**

Once you have shown that triangle ABC is congruent to triangle PQR by one of the above conditions, it means that

\[ \angle A = \angle P \quad AB = PQ \]
\[ \angle B = \angle Q \quad BC = QR \]
\[ \angle C = \angle R \quad AC = PR \]

In other words, the points ABC correspond exactly to the points PQR in that order. Triangle \( \triangle ABC \) is congruent to triangle \( \triangle PQR \) can be written as \( \triangle ABC \equiv \triangle PQR \).

**Example 1**

\( \triangle ABCD \) is a kite. Show that triangle ABC is congruent to triangle ADC.

\[ AB = AD \]
\[ BC = CD \]
\[ AC \text{ is common} \]

So \( \triangle ABC \equiv \triangle ADC \) (SSS)
State whether each pair of triangles in $a$ to $h$ is congruent. If a pair is congruent, give the condition which shows that the triangles are congruent.

$$a$$

$$\triangle ABC$$ where $AB = 8 \text{ cm}$, $BC = 9 \text{ cm}$, $AC = 7.4 \text{ cm}$

$$\triangle PQR$$ where $PQ = 9 \text{ cm}$, $QR = 7.4 \text{ cm}$, $PR = 8 \text{ cm}$

$$b$$

$$\triangle ABC$$ where $AB = 7.5 \text{ cm}$, $AC = 8 \text{ cm}$, $\angle A = 50^\circ$

$$\triangle PQR$$ where $PQ = 8 \text{ cm}$, $QR = 75 \text{ mm}$, $\angle R = 50^\circ$

$$c$$

$$\triangle ABC$$ where $AB = 5 \text{ cm}$, $BC = 6 \text{ cm}$, $\angle B = 35^\circ$

$$\triangle PQR$$ where $PQ = 6 \text{ cm}$, $QR = 50 \text{ mm}$, $\angle Q = 35^\circ$

$$d$$

$$\triangle ABC$$ where $AB = 6 \text{ cm}$, $\angle B = 35^\circ$, $\angle C = 115^\circ$

$$\triangle PQR$$ where $PQ = 6 \text{ cm}$, $\angle Q = 115^\circ$, $\angle R = 35^\circ$

Triangle $ABC$ is congruent to triangle $PQR$, $\angle A = 60^\circ$, $\angle B = 80^\circ$ and $AB = 5 \text{ cm}$. Find these.

i $\angle P$

ii $\angle Q$

iii $\angle R$

iv $PQ$

draw a rectangle $EFGH$. Draw in the diagonal $EG$. Prove that triangle $EFG$ is congruent to triangle $EHG$.

draw an isosceles triangle $ABC$ where $AB = AC$. Draw the line from $A$ to $X$, the mid-point of $BC$. Prove that triangle $ABX$ is congruent to triangle $ACX$.
A transformation changes the position or the size of a shape.

There are four basic ways of changing the position and size of 2-D shapes: a translation, a reflection, a rotation or an enlargement. All of these transformations, except enlargement, keep shapes congruent.

A translation is the “movement” of a shape from one place to another without reflecting it or rotating it. It is sometimes called a glide, since the shape appears to glide from one place to another. Every point in the shape moves in the same direction and through the same distance.

We describe translations by using vectors. A vector is represented by the combination of a horizontal shift and a vertical shift.

**EXAMPLE 2**

Use vectors to describe the translations of the following triangles.

- **a** A to B
- **b** B to C
- **c** C to D
- **d** D to A

**a** The vector describing the translation from A to B is \((2, 1)\).

**b** The vector describing the translation from B to C is \((2, 0)\).

**c** The vector describing the translation from C to D is \((-3, 2)\).

**d** The vector describing the translation from D to A is \((-1, -5)\).

**Note:**
- The top number in the vector describes the horizontal movement. To the right +, to the left −.
- The bottom number in the vector describes the vertical movement. Upwards +, downwards −.
Use vectors to describe the following translations.

- A to B
- A to C
- A to D
- A to E
- A to F
- A to G
- B to A
- B to C
- B to D
- B to E
- B to F
- B to G
- C to A
- C to B
- C to D
- C to E
- C to F
- C to G
- D to E
- D to B
- F to C
- G to D
- F to G
- G to E

Draw the triangle with coordinates A(1,1), B(2,1) and C(1,3).

Draw the image of ABC after a translation with vector \( \begin{pmatrix} 2 \\ 3 \end{pmatrix} \). Label this triangle P.

Draw the image of ABC after a translation with vector \( \begin{pmatrix} -1 \\ -2 \end{pmatrix} \). Label this triangle Q.

Draw the image of ABC after a translation with vector \( \begin{pmatrix} 3 \\ -2 \end{pmatrix} \). Label this triangle R.

Draw the image of ABC after a translation with vector \( \begin{pmatrix} -2 \\ 4 \end{pmatrix} \). Label this triangle S.

Using your diagram from question 2, use vectors to describe the translation that will move

- P to Q
- Q to R
- R to S
- S to P
- R to P
- S to Q
- R to Q
- P to S

Take a 10 \times 10 grid and the triangle A(0, 0), B(1, 0) and C(0, 1). How many different translations are there that use integer values only and will move the triangle ABC to somewhere in the grid?
A reflection transforms a shape so that it becomes a mirror image of itself.

**EXAMPLE 3**

Notice the reflection of each point in the original shape, called the object, is perpendicular to the mirror line. So if you “fold” the whole diagram along the mirror line, the object will coincide with its reflection, called its image.

**EXERCISE 8C**

Copy the diagram below and draw the reflection of the given triangle in the following lines.

- \( a \ x = 2 \)
- \( b \ x = -1 \)
- \( c \ x = 3 \)
- \( d \ y = 2 \)
- \( e \ y = -1 \)
- \( f \ y\)-axis
a Draw a pair of axes, x-axis from –5 to 5, y-axis from –5 to 5.
b Draw the triangle with coordinates A(1, 1), B(3, 1), C(4, 5).
c Reflect the triangle ABC in the x-axis. Label the image P.
d Reflect triangle P in the y-axis. Label the image Q.
e Reflect triangle Q in the x-axis. Label the image R.
f Describe the reflection that will move triangle ABC to triangle R.

a Draw a pair of axes, x-axis from –5 to +5 and y-axis from –5 to +5.
b Reflect the points A(2, 1), B(5, 0), C(–3, 3), D(3, –2) in the x-axis.
c What do you notice about the values of the coordinates of the reflected points?
d What would the coordinates of the reflected point be if the point \((a, b)\) were reflected in the x-axis?

a Draw a pair of axes, x-axis from –5 to +5 and y-axis from –5 to +5.
b Reflect the points A(2, 1), B(0, 5), C(3, –2), D(–4, –3) in the y-axis.
c What do you notice about the values of the coordinates of the reflected points?
d What would the coordinates of the reflected point be if the point \((a, b)\) were reflected in the y-axis?

Draw each of these triangles on squared paper, leaving plenty of space on the opposite side of the given mirror line. Then draw the reflection of each triangle.

a Draw a pair of axes and the lines \(y = x\) and \(y = –x\), as shown.
b Draw the triangle with coordinates A(2, 1), B(5, 1), C(5, 3).
c Draw the reflection of triangle ABC in the x-axis and label the image P.
d Draw the reflection of triangle P in the line \(y = –x\) and label the image Q.
e Draw the reflection of triangle Q in the y-axis and label the image R.
f Draw the reflection of triangle R in the line \(y = x\) and label the image S.
g Draw the reflection of triangle S in the x-axis and label the image T.
h Draw the reflection of triangle T in the line \(y = –x\) and label the image U.
i Draw the reflection of triangle U in the y-axis and label the image W.
j What single reflection will move triangle W to triangle ABC?
Copy the diagram and reflect the triangle in these lines.

- \( a \ y = x \)
- \( b \ x = 1 \)
- \( c \ y = -x \)
- \( d \ y = -1 \)

- \( a \) Draw a pair of axes, \( x \)-axis from –5 to +5 and \( y \)-axis from –5 to +5.
- \( b \) Draw the line \( y = x \).
- \( c \) Reflect the points A(2, 1), B(5, 0), C(–3, 2), D(–2, –4) in the line \( y = x \).
- \( d \) What do you notice about the values of the coordinates of the reflected points?
- \( e \) What would the coordinates of the reflected point be if the point \((a, b)\) were reflected in the line \( y = x \)?

- \( a \) Draw a pair of axes, \( x \)-axis from –5 to +5 and \( y \)-axis from –5 to +5.
- \( b \) Draw the line \( y = -x \).
- \( c \) Reflect the points A(2, 1), B(0, 5), C(3, –2), D(–4, –3) in the line \( y = -x \).
- \( d \) What do you notice about the values of the coordinates of the reflected points?
- \( e \) What would the coordinates of the reflected point be if the point \((a, b)\) were reflected in the line \( y = -x \)?

**Rotations**

In this section you will learn how to:
- rotate a 2-D shape about a point

Key words
- angle of rotation
- anticlockwise
- centre of rotation
- clockwise
- rotation

A rotation transforms a shape to a new position by turning it about a fixed point called the centre of rotation.
On squared paper, draw each of these shapes and its centre of rotation, leaving plenty of space all round the shape.

a Rotate each shape about its centre of rotation

i first by 90° clockwise (call the image A) ii then by 90° anticlockwise (call the image B).

b Describe, in each case, the rotation that would take

i A back to its original position ii A to B.

Copy the diagram and rotate the given triangle by the following.

a 90° clockwise about (0, 0)
b 180° about (3, 3)
c 90° anticlockwise about (0, 2)
d 180° about (−1, 0)
e 90° clockwise about (−1, −1)
What other rotations are equivalent to these rotations?

- 270° clockwise
- 90° clockwise
- 60° anticlockwise
- 100° anticlockwise

a. Draw a pair of axes where both the x and y values are from –5 to 5.

b. Draw the triangle ABC, where A = (1, 2), B = (2, 4) and C = (4, 1).

c. i. Rotate triangle ABC 90° clockwise about the origin (0, 0) and label the image A', B', C', where A' is the image of A, etc.
   
   ii. Write down the coordinates of A', B', C'.

   iii. What connection is there between A, B, C and A', B', C'?

   iv. Will this connection always be so for a 90° clockwise to rotation about the origin?

Repeat question 4, but rotate triangle ABC through 180°.

Repeat question 4, but rotate triangle ABC 90° anticlockwise.

Show that a reflection in the x-axis followed by a reflection in the y-axis is equivalent to a rotation of 180° about the origin.

Show that a reflection in the line y = x followed by a reflection in the line y = –x is equivalent to a rotation of 180° about the origin.

a. Draw a regular hexagon ABCDEF with centre O.

b. Using O as the centre of rotation, describe a transformation that will result in the following movements.

   i. triangle AOB to triangle BOC
   
   ii. triangle AOB to triangle COD
   
   iii. triangle AOB to triangle DOE

   iv. triangle AOB to triangle EOF

c. Describe the transformations that will move the rhombus ABCO to these positions.

   i. rhombus BCDO
   
   ii. rhombus DEFO
An enlargement changes the size of a shape to give a similar image. It always has a **centre of enlargement** and a **scale factor**. Every length of the enlarged shape will be

Original length \( \times \) Scale factor

The distance of each image point on the enlargement from the centre of enlargement will be

Distance of original point from centre of enlargement \( \times \) Scale factor

**EXAMPLE 5**

The diagram shows the enlargement of triangle ABC by scale factor 3 about the centre of enlargement X.

Note:
- Each length on the enlargement \( A'B'C' \) is three times the corresponding length on the original shape. This means that the corresponding sides are in the same ratio:

\[
\frac{AB}{A'B'} = \frac{AC}{A'C'} = \frac{BC}{B'C'} = 1:3
\]

- The distance of any point on the enlargement from the centre of enlargement is three times longer than the distance from the corresponding point on the original shape to the centre of enlargement.

There are two distinct ways to enlarge a shape: the ray method and the coordinate method.
Ray method

This is the only way to construct an enlargement when the diagram is not on a grid.

**EXAMPLE 6**

Enlarge triangle ABC by scale factor 3 about the centre of enlargement X.

Notice that the rays have been drawn from the centre of enlargement to each vertex and beyond.

The distance from X to each vertex on triangle ABC is measured and multiplied by 3 to give the distance from X to each vertex A', B' and C' for the enlarged triangle A'B'C'.

Once each image vertex has been found, the whole enlarged shape can then be drawn.

Check the measurements and see for yourself how the calculations have been done.

Notice again that the length of each side on the enlarged triangle is three times longer than the length of the corresponding side on the original triangle.

Counting squares method

**EXAMPLE 7**

Enlarge the triangle ABC by scale factor 3 from the centre of enlargement (1, 2).

To find the coordinates of each image vertex, first work out the horizontal and vertical distances from each original vertex to the centre of enlargement.

Then multiply each of these distances by 3 to find the position of each image vertex.

For example, to find the coordinates of C' work out the distance from the centre of enlargement (1, 2) to the point C(3, 5).

- horizontal distance = 2
- vertical distance = 3

Make these 3 times longer to give
- new horizontal distance = 6
- new vertical distance = 9

So the coordinates of C' are

\[(1 + 6, 2 + 9) = (7, 11)\]

Notice again that the length of each side is three times longer in the enlargement.
Negative enlargement

A negative enlargement produces an image shape on the opposite side of the centre of enlargement to the original shape.

**EXAMPLE 8**

Triangle ABC has been enlarged by scale factor $-2$, with the centre of enlargement at $(1, 0)$.

You can enlarge triangle ABC to give triangle $A'B'C'$ by either the ray method or the coordinate method.

You calculate the new lengths on the opposite side of the centre of enlargement to the original shape.

Notice how a negative scale factor also inverts the original shape.

Fractional enlargement

Strange but true ... you can have an enlargement in mathematics that is actually smaller than the original shape!

**EXAMPLE 9**

Triangle ABC has been enlarged by a scale factor of $\frac{1}{2}$ about the centre of enlargement $O$ to give triangle $A'B'C'$.

**EXERCISE 8E**

Make larger copies of each of these figures with its centre of enlargement, leaving plenty of space for the enlargement. Then enlarge it by the given scale factor, using the ray method.

- Scale factor 2
- Scale factor 3
- Scale factor 2
- Scale factor $-3$
a. Draw a triangle ABC on squared paper.

b. Mark four different centres of enlargement on your diagram as follows.
   - one above your triangle
   - one to the left of your triangle
   - one below your triangle
   - one to the right of your triangle

c. Enlarge the triangle by a scale factor of 2 from each centre.

d. What do you notice about each enlarged shape?

Enlarge each of these shapes by a scale factor of $\frac{1}{2}$ about the given centre of enlargement.

Copy this diagram onto squared paper.

a. Enlarge the rectangle A by scale factor $\frac{1}{2}$ about the origin.
   Label the image B.

b. Write down the ratio of the lengths of the sides of rectangle A to the lengths of the sides of rectangle B.

c. Work out the ratio of the perimeter of rectangle A to the perimeter of rectangle B.

d. Work out the ratio of the area of rectangle A to the area of rectangle B.

Copy the diagram onto squared paper.

a. Enlarge A by a scale factor of 3 about a centre (4, 5).

b. Enlarge B by a scale factor $\frac{1}{2}$ about a centre (−1, −3).

c. Enlarge B by scale factor $-\frac{1}{2}$ about a centre (−3, −1).

d. What is the centre of enlargement and scale factor which maps B onto A?

e. What is the centre of enlargement and scale factor which maps A onto B?

f. What is the centre of enlargement and scale factor which maps the answer to part b to the answer to part c?

g. What is the centre of enlargement and scale factor which maps the answer to part c to the answer to part b?

h. What is the connection between the scale factors and the centres of enlargement in parts d and e, and in parts f and g?
Examination questions often require you to use more than one transformation in a question. This exercise will revise the transformations you have met in this chapter.

Describe fully the transformations that will map the shaded triangle onto each of the triangles A–F.

Describe fully the transformations that will result in the following movements.

a  $T_1$ to $T_2$

b  $T_1$ to $T_6$

c  $T_2$ to $T_3$

d  $T_6$ to $T_2$

e  $T_5$ to $T_5$

f  $T_5$ to $T_4$
a Plot a triangle T with vertices (1,1), (2,1), (1,3).

b Reflect triangle T in the y-axis and label the image T_b.

c Rotate triangle T_b, 90° anticlockwise about the origin and label the image T_c.

d Reflect triangle T_c in the y-axis and label the image T_d.

e Describe fully the transformation that will move triangle T_d back to triangle T.

The point P(3, 4) is reflected in the x-axis, then rotated by 90° clockwise about the origin. What are the coordinates of the image of P?

A point Q(5, 2) is rotated by 180°, then reflected in the x-axis.

a What are the coordinates of the image point of Q?

b What single transformation would have taken point Q directly to the image point?

Find the coordinates of the image of the point (3, 5) after a clockwise rotation of 90° about the point (1, 3).

Describe fully at least three different transformations that could move the square labelled S to the square labelled T.

The point A(4, 4) has been transformed to the point A'(4, -4). Describe as many different transformations as you can that could transform point A to point A'.

Describe the single transformation equivalent to a reflection in the y-axis followed by a reflection in the x-axis.
Describe fully the single transformation that maps shape P onto shape Q.

Edexcel, Question 2, Paper 10A Higher, January 2003

a Copy the grid below.
   i Reflect the shaded triangle in the line \( y = -x \). Label it A.
   ii Rotate the shaded triangle 90° clockwise about \((-1, 1)\). Label it B.

b Describe the single transformation that takes triangle A to triangle B.

Triangle A and triangle B have been drawn on the grid. Describe fully the single transformation which will map triangle A onto triangle B.

Edexcel, Question 3, Paper 5 Higher, June 2005

a On a copy of the grid, translate triangle A by the vector \( \begin{pmatrix} 4 \\ 1 \end{pmatrix} \). Label the triangle B.

b On the copy of the grid, enlarge triangle A by a scale factor of \( \frac{3}{2} \) about the point \((5, 2)\).

PQRS is a parallelogram. Prove that triangle PQS is congruent to triangle RSQ.

Edexcel, Question 15a, Paper 5 Higher, November 2004
WORKED EXAM QUESTION

The grid shows two congruent shapes, A and B.

Solution

a A rotation of 180° about the point (1, 3). Use tracing paper to rotate the triangle until the centre of rotation is located.

b Use the ray method or the counting squares method. Remember a negative scale factor inverts the shape on the other side of the centre of enlargement.

a Describe the single transformation of shape A to shape B.

b On a copy of the grid, draw the enlargement of shape A by scale factor –2, centre of enlargement (2, 1).
GRADE YOURSELF

Able to reflect a 2-D shape in a line $x = a$ or $y = b$
Able to rotate a 2-D shape about the origin
Able to enlarge a 2-D shape by a whole number scale factor
Able to translate a 2-D shape by a vector
Able to reflect a 2-D shape in the line $y = x$ or $y = -x$
Able to rotate a 2-D shape about any point
Able to enlarge a 2-D shape by a fractional scale factor
Able to enlarge a 2-D shape about any point
Know the conditions to show two triangles are congruent
Able to enlarge a 2-D shape by a negative scale factor
Able to prove two triangles are congruent

What you should know now

- How to translate a 2-D shape by a vector
- How to reflect a 2-D shape in any line
- How to rotate a 2-D shape about any point and through any angle
- How to enlarge a 2-D shape about any point using a positive, fractional or negative scale factor
- How to show that two triangles are congruent
This chapter will show you ...

- how to bisect a line and an angle
- how to construct perpendiculars
- how to define a locus
- how to solve locus problems

What you should already know

- How to construct triangles using a protractor and a pair of compasses
- How to use scale drawings

Quick check

Construct these triangles using a ruler, protractor and a pair of compasses.

1.  
   ![Triangle 1](image1)
   - Base: 6 cm
   - Height: 4 cm
   - Angles: 52°, 65°, 65°

2.  
   ![Triangle 2](image2)
   - Base: 4 cm
   - Height: 6 cm
   - Angles: 65°, 75°, 65°

3.  
   ![Triangle 3](image3)
   - Base: 5 cm
   - Height: 4 cm
   - Angles: 75°, 75°, 60°
In this section you will learn how to:

- bisect a line and an angle

Key words

angle bisector
bisector
line bisector
perpendicular bisector

To bisect means to divide in half. So a **bisector** divides something into two equal parts.

- A **line bisector** divides a straight line into two equal lengths.
- An **angle bisector** is the straight line which divides an angle into two equal angles.

**EXAMPLE 1**

To construct a line bisector

It is usually more accurate to construct a line bisector than to measure its position (the midpoint of the line).

Bisect the line AB.

1. Open your compasses to a radius of about three quarters of the length of the line. Using A and B as centres, draw two intersecting arcs without changing the radius of your compasses.

2. Join the two points at which the arcs intersect to meet AB at X. This line is known as the **perpendicular bisector** of AB.

X is the midpoint of AB.
EXAMPLE 2

To construct an angle bisector

It is much more accurate to construct an angle bisector than to measure with a protractor.

Bisect $\angle BAC$.

- Open your compasses to any reasonable radius, if in doubt, go for about 3 cm. With centre at $A$, draw an arc through both lines of the angle.

- With centres at the two points at which this arc intersects the lines, draw two more arcs so that they intersect at $X$. (The radius of the compasses may have to be increased to do this.)

- Join $AX$.

This line is the angle bisector of $\angle BAC$.

So $\angle BAX = \angle CAX$.

EXERCISE 9A

In this exercise, it is important to leave in all your construction lines.

1. Draw a line 7 cm long. Bisect it using a pair of compasses and a ruler only. Check your accuracy by measuring to see if each half is 3.5 cm.

2. a. Draw any triangle whose sides are between 5 cm and 10 cm.

   b. On each side construct the perpendicular bisector as on the diagram. All your perpendicular bisectors should intersect at the same point.

   c. Use this point as the centre of a circle that touches each vertex of the triangle. Draw this circle. This circle is known as the circumscribed circle of the triangle.

3. Repeat question 2 with a different triangle and check that you get a similar result.

4. a. Draw a quadrilateral whose opposite angles add up to 180°.

   b. On each side construct the perpendicular bisectors. They all should intersect at the same point.

   c. Use this point as the centre of a circle that touches the quadrilateral at each vertex. Draw this circle.

5. a. Draw an angle of 50°.

   b. Construct the angle bisector.

   c. Use a protractor to check how accurate you have been. Each angle should be 25°.
a Draw any triangle whose sides are between 5 cm and 10 cm.

b At each angle construct the angle bisector as on the diagram. All three bisectors should intersect at the same point.

c Use this point as the centre of a circle that touches each side of the triangle once. Draw this circle. This circle is known as the *inscribed circle* of the triangle.

Repeat question 6 with a different triangle and check that you get a similar result.

---

**9.2 Other angle constructions**

**In this section you will learn how to:**
- construct perpendiculars from a point
- construct an angle of 60°

**Key words**
- construct
- perpendicular

**EXAMPLE 3**

To construct a perpendicular from a point on a line

This construction will produce a perpendicular from a point $A$ on a line.

- Open your compasses to about 2 or 3 cm. With point $A$ as centre, draw two short arcs to intersect the line at each side of the point.
- Now extend the radius of your compasses to about 4 cm. With centres at the two points at which the arcs intersect the line, draw two arcs to intersect at $X$ above the line.
- Join $AX$.

$AX$ is perpendicular to the line.

**Note:** If you needed to construct a 90° angle at the end of a line, you would first have to extend the line.

You could be even more accurate by also drawing two arcs underneath the line, which would give three points in line.
EXAMPLE 4

To construct a perpendicular from a point to a line
This construction will produce a perpendicular from a point A to a line.

• With point A as centre, draw an arc which intersects the line at two points.
• With centres at these two points of intersection, draw two arcs to intersect each other both above and below the line.
• Join the two points at which the arcs intersect. The resulting line passes through point A and is perpendicular to the line.

Examination note: When a question says construct, you must only use compasses – no protractor. When it says draw, you may use whatever you can to produce an accurate diagram. But also note, when constructing you may use your protractor to check your accuracy.

EXAMPLE 5

To construct an angle of 60°
This construction will produce an angle of 60° from a point A on a line.

• Open your compasses to about 3 cm. With point A as centre, draw an arc from above to intersect the line at point B.
• With point B as centre, draw a second arc which passes through point A to intersect the first arc at point C.
• Join AC.

$\angle CAB = 60°$
In this exercise, it is important to leave in all your construction lines.

1. Construct these triangles accurately without using a protractor.

2. a Without using a protractor, construct a square of side 6 cm.
   b See how accurate you have been by constructing an angle bisector on any of the right angles and seeing whether this also cuts through the opposite right angle.

3. a Construct an angle of 90°.
   b Bisect this angle to construct an angle of 45°.

4. a Construct these angles. i 30° ii 15° iii 22.5° iv 75°
   b Check your accuracy by measuring with a protractor. (The allowable error is ±1°.)

5. With ruler and compasses only, construct these triangles.

6. Construct an isosceles triangle ABC, where AB = AC = 7 cm and ∠CAB = 120°.

7. Construct a trapezium whose parallel sides are 8 cm and 6 cm, and having an angle of 60° at each end of the longer side.

8. a Construct the triangle ABC, where AB = 7 cm, ∠BAC = 60° and ∠ABC = 45°.
   b Measure the lengths of AC and BC.

9. a Construct the triangle PQR, where PQ = 8 cm, ∠RPQ = 30° and ∠PQR = 45°.
   b Measure the lengths of PR and RQ.

10. Construct a parallelogram which has sides of 6 cm and 8 cm and with an angle of 105°.

11. Draw a straight line and mark a point above the line. Construct the perpendicular which passes through that point to the line.
Defining a locus

In this section you will learn how to:
● draw a locus for a given rule

Key words
loci
locus

A locus (plural loci) is the movement of a point according to a given rule.

**EXAMPLE 6**
A point P that moves so that it is always at a distance of 5 cm from a fixed point A will have a locus that is a circle of radius 5 cm.
You can express this mathematically by saying the locus of the point P is such that \( AP = 5 \text{ cm} \).

**EXAMPLE 7**
A point P that moves so that it is always the same distance from two fixed points A and B will have a locus that is the perpendicular bisector of the line joining A and B.
You can express this mathematically by saying the locus of the point P is such that \( AP = BP \).

**EXAMPLE 8**
A point that moves so that it is always 5 cm from a line AB will have a locus that is a racetrack shape around the line.
This is difficult to express mathematically.

In your GCSE examination, you will usually get practical situations rather than abstract mathematical ones.

**EXAMPLE 9**
A point that is always 5 m from a long, straight wall will have a locus that is a line parallel to the wall and 5 m from it.
A is a fixed point. Sketch the locus of the point P in each of these situations.

a \( \text{AP} = 2 \text{ cm} \)

b \( \text{AP} = 4 \text{ cm} \)

c \( \text{AP} = 5 \text{ cm} \)

A and B are two fixed points 5 cm apart. Sketch the locus of the point P for each of these situations.

a \( \text{AP} = \text{BP} \)

b \( \text{AP} = 4 \text{ cm} \) and \( \text{BP} = 4 \text{ cm} \)

c \( \text{P} \) is always within 2 cm of the line AB

A horse is tethered in a field on a rope 4 m long. Describe or sketch the area that the horse can graze.

The horse is still tethered by the same rope but there is now a long, straight fence running 2 m from the stake. Sketch the area that the horse can now graze.

ABCD is a square of side 4 cm. In each of the following loci, the point P moves only inside the square. Sketch the locus in each case.

a \( \text{AP} = \text{BP} \)

b \( \text{AP} < \text{BP} \)

c \( \text{AP} = \text{CP} \)

d \( \text{CP} < 4 \text{ cm} \)

\( \text{e} \) \( \text{CP} > 2 \text{ cm} \)

f \( \text{CP} > 5 \text{ cm} \)

One of the following diagrams is the locus of a point on the rim of a bicycle wheel as it moves along a flat road. Which is it?

One of the following diagrams is the locus of the centre of the wheel for the bicycle in question 6.
Most of the **loci** problems in your GCSE examination will be of a practical nature, as in the next example.

**EXAMPLE 11**

Imagine that a radio company wants to find a site for a transmitter. The transmitter must be the same distance from Doncaster and Leeds and within 20 miles of Sheffield.

In mathematical terms, this means they are concerned with the perpendicular bisector between Leeds and Doncaster and the area within a circle of radius 20 miles from Sheffield.

The map, drawn to a **scale** of 1 cm = 10 miles, illustrates the situation and shows that the transmitter can be built anywhere along the thick part of the blue line.

**EXERCISE 9D**

For questions 1 to 7, you should start by sketching the picture given in each question on a $6 \times 6$ grid, each square of which is 1 cm by 1 cm. The scale for each question is given.

1. A goat is tethered by a rope, 7 m long, in a corner of a field with a fence at each side. What is the locus of the area that the goat can graze? Use a scale of 1 cm = 2 m.

2. In a field a horse is tethered to a stake by a rope 6 m long. What is the locus of the area that the horse can graze? Use a scale of 1 cm = 2 m.
A cow is tethered to a rail at the top of a fence 6 m long. The rope is 3 m long. Sketch the area that the cow can graze. Use a scale of 1 cm = 2 m.

A horse is tethered to a stake near a corner of a fenced field, at a point 4 m from each fence. The rope is 6 m long. Sketch the area that the horse can graze. Use a scale of 1 cm = 2 m.

A horse is tethered to a corner of a shed, 2 m by 1 m. The rope is 2 m long. Sketch the area that the horse can graze. Use a scale of 1 cm = 1 m.

A goat is tethered by a 4 m rope to a stake at one corner of a pen, 4 m by 3 m. Sketch the area of the pen on which the goat cannot graze. Use a scale of 1 cm = 1 m.

A puppy is tethered to a stake by a rope, 1.5 m long, on a flat lawn on which are two raised brick flower beds. The stake is situated at one corner of a bed, as shown. Sketch the area that the puppy is free to roam in. Use a scale of 1 cm = 1 m.

For questions 8 to 15, you should use a copy of the map opposite. For each question, trace the map and mark on those points that are relevant to that question.

A radio station broadcasts from London on a frequency of 1000 kHz with a range of 300 km. Another radio station broadcasts from Glasgow on the same frequency with a range of 200 km.

- Sketch the area to which each station can broadcast.
- Will they interfere with each other?
- If the Glasgow station increases its range to 400 km, will they then interfere with each other?

The radar at Leeds airport has a range of 200 km. The radar at Exeter airport has a range of 200 km.

- Will a plane flying over Birmingham be detected by the Leeds radar?
- Sketch the area where a plane can be picked up by both radars at the same time.
A radio transmitter is to be built according to these rules.

i. It has to be the same distance from York and Birmingham.

ii. It must be within 350 km of Glasgow.

iii. It must be within 250 km of London.

a. Sketch the line that is the same distance from York and Birmingham.

b. Sketch the area that is within 350 km of Glasgow and 250 km of London.

c. Show clearly the possible places at which the transmitter could be built.

A radio transmitter centred at Birmingham is designed to give good reception in an area greater than 150 km and less than 250 km from the transmitter. Sketch the area of good reception.

Three radio stations pick up a distress call from a boat in the Irish Sea. The station at Glasgow can tell from the strength of the signal that the boat is within 300 km of the station. The station at York can tell that the boat is between 200 km and 300 km from York. The station at London can tell that it is less than 400 km from London. Sketch the area where the boat could be.

Sketch the area that is between 200 km and 300 km from Newcastle upon Tyne, and between 150 km and 250 km from Bristol.

An oil rig is situated in the North Sea in such a position that it is the same distance from Newcastle upon Tyne and Manchester. It is also the same distance from Sheffield and Norwich. Draw the line that shows all the points that are the same distance from Newcastle upon Tyne and Manchester. Repeat for the points that are the same distance from Sheffield and Norwich and find out where the oil rig is located.

Whilst looking at a map, Fred notices that his house is the same distance from Glasgow, Norwich and Exeter. Where is it?

Wathsea Harbour is as shown in the diagram.
A boat sets off from point A and steers so that it keeps the same distance from the sea wall and the West Pier. Another boat sets off from B and steers so that it keeps the same distance from the East Pier and the sea wall. Copy the diagram below, and on your diagram show accurately the path of each boat.

The curve $x^2 + y^2 = 25$ is a circle of radius 5 centred on the origin.

a. Show that the points (3, 4) and (–4, 3) lie on the curve.

b. Sketch the loci of the curve $x^2 + y^2 = 16$ showing clearly the values where it crosses the axes.
5. Make an accurate drawing of this triangle.

[Diagram of a triangle with sides 6 cm, 9 cm, and 7 cm, and angles 45° and 90°.]

6. Construct an accurate drawing of this triangle.

[Diagram of a triangle with sides 6 cm, 7 cm, and 8 cm, and angles 70° and 90°.]

7. The map shows a small island with two towns A and B. Town B is north west of town A. The map is drawn to a scale of 1 square to 10 km.

[Map showing town A and town B with north west direction.]

a. What bearing is the direction north west?

b. A mobile phone mast is to be built. It has to be within 40 km of both towns. Copy the map and shade the area in which the mast could be built.

8. The diagram represents a triangular garden ABC. The scale of the diagram is 1 cm represents 1 m. A tree is to be planted in the garden so that it is nearer to AB than to AC, within 5 m of point A.

[Diagram of a triangle ABC with sides 8 cm, 8 cm, and 10 cm, and angle 70°.]

a. Construct an accurate drawing of this triangle.

b. Measure the length BC.

b. Construct an angle of 60°.

b. Copy the line AB and then construct the perpendicular bisector of the points A and B.

Edexcel, Question 7, Paper 5 Higher, June 2003
CHAPTER 9: CONSTRUCTIONS

Use a ruler and compasses to construct the perpendicular from P to the line segment XY. You must show all construction lines.

This is a map of part of Northern England.

A radio station in Manchester transmits programmes. Its programmes can be received anywhere within a distance of 30 km.

On a copy of the diagram, shade the region in which the programmes can be received.

Edexcel, Question 2, Paper 6 Higher, June 2004

Use a ruler and compasses to construct the bisector of angle ABC. You must show all construction lines.

The diagram shows three points A, B and C on a centimetre grid.

a On a copy of the grid, draw the locus of points which are equidistant from A and B.

b On a copy of the grid, draw the locus of points that are 3 cm from C.

c On a copy of the grid, shade the region in which points are nearer to A than B and also less than 3 cm from C.

Edexcel, Question 1, Paper 13A Higher, January 2004
WORKED EXAM QUESTION

The map shows two trees, A and B, in a park. At the edge of the park there is a straight path.

A new tree, C, is to be planted in the park.

The tree must be:
- more than 60 m from the path,
- closer to A than B,
- more than 100 m from A.

Using a ruler and compasses only, shade the region where the tree could be planted.
You must show all construction lines.

Solution

Draw a parallel line 3 cm from the path.

Draw the perpendicular bisector of AB.

Draw a circle of radius 5 cm at A.

The region required is shaded on the diagram.
Bill the builder builds a street of 100 bungalows, 50 on each side of the street. He builds them in blocks of 5. The bungalows at the end of the blocks are called end-terraced, and the other bungalows are called mid-terraced.

A tree is to be planted in the back garden of each mid-terraced house. The tree must be at least 2 m from the back of the house, at least 1 m from the back fence of the garden, and at least 3.5 m from each of the bottom corners of the garden. It must also be at least 1.5 m from the garden shed.

Draw an accurate scale drawing, using a scale of 1 cm = 1 m, of a mid-terraced house and garden. Shade the region in which Bill can plant the tree.
Bill needs to work out the number and cost, as well as the weight of the roof slates needed for the whole street.

Each roof slate costs 24p, 17.4 slates cover one square metre of roof, and 1000 slates weigh 2400 kg.

Using the dimensions on the plan and the height given on the first block shown on the left, help Bill to fill in the table. Give the areas to the nearest square metre.

<table>

GRADE YOURSELF

- Able to construct line and angle bisectors
- Able to draw and describe the locus of a point from a given rule
- Able to solve problems using loci
- Able to construct a perpendicular from a point on a line
- Able to construct a perpendicular from a point to a line
- Able to construct an angle of 60°

What you should know now

- How to construct line and angle bisectors
- How to construct perpendiculars
- How to construct angles without a protractor
- Understand what is meant by a locus
- How to solve problems using loci
This chapter will show you ...

- how to calculate with indices
- how to write numbers in standard form and how to calculate with standard form
- how to convert fractions to terminating and recurring decimals, and vice versa
- how to work out a reciprocal
- how to calculate with surds

Visual overview

What you should already know

- How to convert a fraction to a decimal
- How to convert a decimal to a fraction
- How to find the lowest common denominator of two fractions
- The meaning of square root and cube root

Quick check

1. Convert the following fractions to decimals.
   - a \( \frac{1}{8} \)
   - b \( \frac{1}{3} \)
   - c \( \frac{1}{9} \)

2. Convert the following decimals to fractions.
   - a 0.17
   - b 0.64
   - c 0.858

3. Work these out.
   - a \( \frac{1}{4} + \frac{1}{6} \)
   - b \( \frac{1}{2} - \frac{1}{3} \)

4. Write down the values.
   - a \( \sqrt{25} \)
   - b \( 3\sqrt{64} \)
The index is the number of times a number is multiplied by itself. For example,

\[ 4^6 = 4 \times 4 \times 4 \times 4 \times 4 \times 4, \quad 6^4 = 6 \times 6 \times 6 \times 6, \quad 7^3 = 7 \times 7 \times 7, \quad 12^2 = 12 \times 12 \]

Here, 4 has an index of 6, 6 has an index of 4, 7 has an index of 3 and 12 has an index of 2.

Indices (or powers) can also be used to simplify the writing of repetitive multiplications. For example,

\[ 3 \times 3 \times 3 \times 3 \times 3 \times 3 = 3^6, \quad 13 \times 13 \times 13 \times 13 = 13^4, \quad 7 \times 7 \times 7 \times 7 = 7^4 \]

A commonly used power is “2”, which has the special name “squared”. The only other power with a special name is “3”, which is called “cubed”.

The value of “7 squared” is \( 7^2 = 7 \times 7 = 49 \) and the value of “5 cubed” is \( 5^3 = 5 \times 5 \times 5 = 125 \).

**Working out indices on your calculator**

How do we work out the value of \( 5^7 \) on a calculator?

We could do the calculation as \( 5 \times 5 \times 5 \times 5 \times 5 \times 5 \times 5 \), but if we tried to key this in, we would probably end up missing a “\( \times \) 5” or pressing a wrong key. Instead, we use the power key \( x^y \) (or, on some calculators, \( y^x \)). So

\[ 5^7 = 5 \times^y 7 = 78125 \]

Make sure you know where to find the power key on your calculator. It may be an INV or SHIFT function.

**Two special powers**

Choose any number, say 5, and use your calculator to raise it to the power 1. You will find that \( 5^1 = 5 \). That is, a number raised to the power 1 stays the same number. This is true for any number, so we do not normally write down the power 1.

Choose any number, say 9, and use your calculator to raise it to the power 0. You will find that \( 9^0 = 1 \). This is true for any number raised to the power 0. The answer is always 1.
Write these expressions using power notation. Do not work them out yet.

- \(a = 2 \times 2 \times 2 \times 2\)
- \(b = 3 \times 3 \times 3 \times 3\)
- \(c = 7 \times 7\)
- \(d = 5 \times 5 \times 5\)
- \(e = 10 \times 10 \times 10 \times 10 \times 10 \times 10\)
- \(f = 6 \times 6 \times 6 \times 6\)
- \(g = 4\)
- \(h = 1 \times 1 \times 1 \times 1 \times 1 \times 1\)
- \(i = 0.5 \times 0.5 \times 0.5 \times 0.5\)
- \(j = 100 \times 100 \times 100\)

Write these power terms out in full. Do not work them out yet.

- \(a = 3^4\)
- \(b = 9^3\)
- \(c = 6^2\)
- \(d = 10^5\)
- \(e = 2^{10}\)
- \(f = 8^3\)
- \(g = 0.1^3\)
- \(h = 2.5^2\)
- \(i = 0.7^3\)
- \(j = 1000^2\)

Using the power key on your calculator (or another method), work out the values of the power terms in question 1.

Using the power key on your calculator (or another method), work out the values of the power terms in question 2.

Without using a calculator, work out the values of these power terms.

- \(a = 2^0\)
- \(b = 4^1\)
- \(c = 5^0\)
- \(d = 1^9\)
- \(e = 1^{235}\)

The answers to question 5, parts d and e, should tell you something special about powers of 1. What is it?

Write the answer to question 1, part j as a power of 10.

Write the answer to question 2, part j as a power of 10.

Using your calculator, or otherwise, work out the values of these power terms.

- \(a = (-1)^0\)
- \(b = (-1)^1\)
- \(c = (-1)^2\)
- \(d = (-1)^4\)
- \(e = (-1)^3\)

Using your answers to question 9, write down the answers to these power terms.

- \(a = (-1)^8\)
- \(b = (-1)^{11}\)
- \(c = (-1)^{32}\)
- \(d = (-1)^{80}\)
- \(e = (-1)^{126}\)

**Negative indices**

A negative index is a convenient way of writing the **reciprocal** of a number or term. (That is, one divided by that number or term.) For example,

\[
x^{-a} = \frac{1}{x^a}
\]
Here are some other examples:

\[ 5^{-2} = \frac{1}{5^2} \quad 3^{-1} = \frac{1}{3} \quad 5x^{-2} = \frac{5}{x^2} \]

**EXAMPLE 1**

Rewrite the following in the form \(2^n\).

\[
\begin{align*}
a & \quad \frac{8}{4} \quad b \quad \frac{1}{4} \\
& = 2 \times 2 \times 2 = 2^3 \\
c & \quad -32 = -2^5 \\
d & \quad \frac{1}{64} = \frac{1}{2^6} = -2^{-6}
\end{align*}
\]

**EXERCISE 10B**

1. Write down each of these in fraction form.

\[
\begin{align*}
a & \quad 5^{-3} \quad b \quad 6^{-1} \quad c \quad 10^{-5} \quad d \quad 3^{-2} \quad e \quad 8^{-2} \\
f & \quad 9^{-1} \quad g \quad w^{-2} \quad h \quad t^{-1} \quad i \quad x^{-4m} \quad j \quad 4m^{-3}
\end{align*}
\]

2. Write down each of these in negative index form.

\[
\begin{align*}
a & \quad \frac{1}{3^3} \quad b \quad \frac{1}{5} \quad c \quad \frac{1}{10^4} \quad d \quad \frac{1}{m} \quad e \quad \frac{1}{t^7}
\end{align*}
\]

3. Change each of the following expressions into an index form of the type shown.

\[
\begin{align*}
a & \quad \text{all of the form } 2^n \\
i & \quad 16 \quad ii \quad \frac{1}{2} \quad iii \quad \frac{1}{16} \quad iv \quad -8 \\
b & \quad \text{all of the form } 10^n \\
i & \quad 1000 \quad ii \quad \frac{1}{10} \quad iii \quad \frac{1}{100} \quad iv \quad 1 \text{ million} \\
c & \quad \text{all of the form } 5^n \\
i & \quad 125 \quad ii \quad \frac{1}{5} \quad iii \quad \frac{1}{125} \quad iv \quad \frac{1}{5^3} \\
d & \quad \text{all of the form } 3^n \\
i & \quad 9 \quad ii \quad \frac{1}{3} \quad iii \quad \frac{1}{9} \quad iv \quad -243
\end{align*}
\]

4. Rewrite each of the following expressions in fraction form.

\[
\begin{align*}
a & \quad 5x^{-3} \quad b \quad 6m^{-1} \quad c \quad 7m^{-2} \quad d \quad 4y^{-4} \quad e \quad 10y^{-5} \\
f & \quad \frac{1}{2}x^{-3} \quad g \quad \frac{1}{2}m^{-1} \quad h \quad \frac{3}{4}t^{-4} \quad i \quad \frac{4}{5}y^{-3} \quad j \quad \frac{7}{3}x^{-5}
\end{align*}
\]
Change each fraction to index form.

\[
\begin{align*}
a. & \quad \frac{7}{x^7} \\
b. & \quad \frac{10}{p} \\
c. & \quad \frac{5}{r} \\
d. & \quad \frac{8}{m} \\
e. & \quad \frac{3}{y}
\end{align*}
\]

Find the value of each of the following, where the letters have the given values.

\[
\begin{align*}
a. & \quad \text{Where } x = 5 \\
i. & \quad x^2 \\
ii. & \quad x^{-3} \\
iii. & \quad 4x^{-1} \\
b. & \quad \text{Where } t = 4 \\
i. & \quad t^3 \\
ii. & \quad t^{-2} \\
iii. & \quad 5t^{-4} \\
c. & \quad \text{Where } m = 2 \\
i. & \quad m^3 \\
ii. & \quad m^{-5} \\
iii. & \quad 9m^{-3} \\
d. & \quad \text{Where } w = 10 \\
i. & \quad w^6 \\
ii. & \quad w^{-3} \\
iii. & \quad 25w^{-2}
\end{align*}
\]

Rules for multiplying and dividing numbers in index form

When we multiply together powers of the same number or variable, we add the indices. For example,

\[
\begin{align*}
3^4 \times 3^5 &= 3^{4+5} = 3^9 \\
2^3 \times 2^4 \times 2^5 &= 2^{3+4+5} = 2^{12} \\
10^4 \times 10^{-2} &= 10^{4-2} = 10^2 \\
10^{-3} \times 10^{-1} &= 10^{-3-1} = 10^{-4} \\
a^x \times a^y &= a^{x+y}
\end{align*}
\]

When we divide powers of the same number or variable, we subtract the indices. For example,

\[
\begin{align*}
a^4 \div a^1 &= a^{4-1} = a^3 \\
b^4 \div b^7 &= b^{4-7} \\
10^4 \div 10^2 &= 10^{4-2} = 10^2 \\
10^{-3} \div 10^{-4} &= 10^{-3-(-4)} = 10^1 \\
a^x \div a^y &= a^{x-y}
\end{align*}
\]

When we raise a power term to a further power, we multiply the indices. For example,

\[
\begin{align*}
(a^2)^3 &= a^{2\times3} = a^6 \\
(a^{-2})^4 &= a^{-8} \\
(a^2)^6 &= a^{12} \\
(a^3)^3 &= a^{9}
\end{align*}
\]

Here are some examples of different kinds of power expressions.

\[2a^2 \times 3a^3 = (2 \times 3) \times (a^2 \times a^3) = 6 \times a^5 = 6a^5\]
\[4a^2b^3 \times 2ab^2 = (4 \times 2) \times (a^2 \times a) \times (b^3 \times b^2) = 8a^3b^5\]
\[12a^2 + 3a^3 = (12 \div 3) \times (a^2 \div a^3) = 4a\]
\[(2a^3)^3 = (2)^3 \times (a^2)^3 = 8 \times a^6 = 8a^6\]

- **Exercise 10C**

**Write these as single powers of 5.**

</table>

Use the general rule for dividing powers of the same number, \[\frac{a^m}{a^n} = a^{m-n}\], to prove that any number raised to the power zero is 1.
Indices of the form $\frac{1}{n}$

Consider the problem $7^4 \times 7^3 = 7$. This can be written as:

$$7^{x + 3} = 7$$

$$7^{2x} = 7^1 \Rightarrow 2x = 1 \Rightarrow x = \frac{1}{2}$$

If we now substitute $x = \frac{1}{2}$ back into the original equation, we see that:

$$7^{\frac{1}{2}} \times 7^1 = 7$$

This makes $7^{\frac{1}{2}}$ the same as $\sqrt{7}$.

You can similarly show that $7^{\frac{1}{3}}$ is the same as $\sqrt[3]{7}$. And that, generally,

$$x^\frac{1}{n} = \sqrt[n]{x} \text{ (nth root of } x)$$

For example,

$$49^{\frac{1}{2}} = \sqrt{49} = 7 \quad 8^{\frac{1}{3}} = \sqrt[3]{8} = 2 \quad 10000^{\frac{1}{3}} = \sqrt[3]{10000} = 10 \quad 36^{\frac{1}{6}} = \frac{1}{\sqrt[6]{36}} = \frac{1}{6}$$

**EXERCISE 10D**

Evaluate the following.

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
</table>
| $2^3$ | $100^{\frac{1}{2}}$ | $64^{\frac{1}{3}}$ | $81^{\frac{1}{2}}$ | $625^{\frac{1}{4}}$
| $27^{\frac{1}{3}}$ | $64^{\frac{1}{4}}$ | $1000^{\frac{1}{10}}$ | $125^{\frac{1}{10}}$ | $512^{\frac{1}{10}}$
| $144^{\frac{1}{2}}$ | $400^{\frac{1}{2}}$ | $625^{\frac{1}{4}}$ | $81^{\frac{1}{4}}$ | $100000^{\frac{1}{10}}$
| $729^{\frac{1}{3}}$ | $32^{\frac{1}{5}}$ | $1024^{\frac{1}{5}}$ | $1296^{\frac{1}{6}}$ | $20^{\frac{1}{2}}$ | $216^{\frac{1}{3}}$
| $16^{\frac{1}{4}}$ | $8^{\frac{1}{3}}$ | $81^{\frac{1}{3}}$ | $3125^{\frac{1}{5}}$ | $1000000^{\frac{1}{10}}$
| $\sqrt{\frac{25}{36}}$ | $\sqrt{\frac{100}{36}}$ | $\frac{64}{81}$ | $\sqrt{\frac{81}{25}}$ | $\sqrt[4]{\frac{25}{64}}$
| $\sqrt{\frac{27}{125}}$ | $\sqrt[3]{\frac{8}{512}}$ | $\sqrt[5]{\frac{1000}{64}}$ | $\sqrt[6]{\frac{64}{125}}$ | $\sqrt[10]{\frac{512}{343}}$
| $\sqrt[6]{36}$ | $\sqrt[6]{36}$ | $\sqrt[6]{36}$ | $\sqrt[6]{36}$ | $\sqrt[6]{36}$

Use the general rule for raising a power to another power to prove that $x^\frac{1}{n}$ is equivalent to $\sqrt[n]{x}$

Indices of the form $\frac{a}{b}$

Here are two examples of this form.

$$t^\frac{1}{2} = t^\frac{1}{2} \times t^\frac{1}{2} = (\sqrt{t})^2 \quad 81^\frac{1}{3} = (\sqrt[3]{81})^3 = 3^3 = 27$$

Evaluate the following.  
\[a\ 16^{-\frac{1}{4}} \quad b\ 32^{-\frac{1}{5}}\]

When dealing with negative indices do not make the mistake of thinking that the answer will be negative. Do problems like these in three steps.

**Step 1:** take the root of the base number given by the denominator of the fraction.

**Step 2:** raise the result to the power given by the numerator of the fraction.

**Step 3:** take the reciprocal (divide into 1) of the answer, which is what the negative power tells you to do.

\[a\ \text{Step 1: } \sqrt[4]{16} = 2. \quad \text{Step 2: } 2^{\frac{1}{4}} = 2. \quad \text{Step 3: reciprocal of 2 is } \frac{1}{2}\]

\[b\ \text{Step 1: } \sqrt[5]{32} = 2. \quad \text{Step 2: } 2^{\frac{1}{5}} = 2. \quad \text{Step 3: reciprocal of 16 is } \frac{1}{16}\]

---

**EXERCISE 10E**

**ANSWERS**

1. Evaluate the following.  
   \[a\ 32^{-\frac{1}{5}} \quad b\ 25^{-\frac{1}{2}} \quad c\ 1296^{-\frac{1}{4}} \quad d\ 243^{-\frac{1}{5}}\]

2. Rewrite the following in index form.  
   \[a\ \sqrt{2} \quad b\ \sqrt[3]{m} \quad c\ \sqrt{k}^2 \quad d\ \sqrt{x}^3\]

3. Evaluate the following.  
   \[a\ 8^{-\frac{1}{3}} \quad b\ 27^{-\frac{1}{3}} \quad c\ 16^{-\frac{1}{4}} \quad d\ 625^{-\frac{1}{4}}\]

4. Evaluate the following.  
   \[a\ 25^{-\frac{1}{2}} \quad b\ 36^{-\frac{1}{2}} \quad c\ 16^{-\frac{1}{4}} \quad d\ 81^{-\frac{1}{4}}\]
   e\ 16^{-\frac{1}{3}}\ f\ 8^{-\frac{1}{3}}\ g\ 32^{-\frac{1}{5}}\ h\ 27^{-\frac{1}{3}}\]

5. Evaluate the following.  
   \[a\ 25^{-\frac{1}{2}} \quad b\ 36^{-\frac{1}{2}} \quad c\ 16^{-\frac{1}{4}} \quad d\ 81^{-\frac{1}{4}}\]
   e\ 64^{-\frac{1}{3}}\ f\ 8^{-\frac{1}{3}}\ g\ 32^{-\frac{1}{5}}\ h\ 27^{-\frac{1}{3}}\]

6. Evaluate the following.  
   \[a\ 100^{-\frac{1}{2}} \quad b\ 144^{-\frac{1}{2}} \quad c\ 125^{-\frac{1}{3}} \quad d\ 9^{-\frac{3}{2}}\]
   e\ 4^{-\frac{1}{3}}\ f\ 64^{-\frac{1}{3}}\ g\ 27^{-\frac{1}{3}}\ h\ 169^{-\frac{1}{2}}\]
Arithmetic of powers of 10

Multiplying
You have already done some arithmetic with multiples of 10 in Chapter 1. We will now look at powers of 10.

How many zeros does a million have? What is a million as a power of 10? This table shows some of the pattern of the powers of 10.

<table>
<thead>
<tr>
<th>Number</th>
<th>0.001</th>
<th>0.01</th>
<th>0.1</th>
<th>1</th>
<th>10</th>
<th>100</th>
<th>1000</th>
<th>10 000</th>
<th>100 000</th>
</tr>
</thead>
<tbody>
<tr>
<td>Powers</td>
<td>10⁻³</td>
<td>10⁻²</td>
<td>10⁻¹</td>
<td>10₀</td>
<td>10¹</td>
<td>10²</td>
<td>10³</td>
<td>10⁴</td>
<td>10⁵</td>
</tr>
</tbody>
</table>

What pattern is there in the top row? What pattern is there to the powers in the bottom row?

To multiply by any power of 10, we simply move the digits according to these two rules.

- When the index is positive, move the digits to the left by the same number of places as the value of the index.
- When the index is negative, move the digits to the right by the same number of places as the value of the index.

For example,

- $12.356 \times 10^2 = 1235.6$
- $3.45 \times 10^1 = 34.5$
- $753.4 \times 10^{-2} = 7.534$
- $6789 \times 10^{-1} = 678.9$

In certain cases, we have to insert the “hidden” zeros. For example,

- $75 \times 10^4 = 750 000$
- $2.04 \times 10^5 = 204 000$
- $6.78 \times 10^{-3} = 0.00678$
- $0.897 \times 10^{-4} = 0.0000897$

Dividing
To divide by any power of 10, we simply move the digits according to these two rules.

- When the index is positive, move the digits to the right by the same number of places as the value of the index.
- When the index is negative, move the digits to the left by the same number of places as the value of the index.
For example,

\[ 712.35 \div 10^2 = 7.1235 \]
\[ 38.45 \div 10^1 = 3.845 \]
\[ 3.463 \div 10^{-2} = 346.3 \]
\[ 6.789 \div 10^{-1} = 67.89 \]

In certain cases, we have to insert the “hidden” zeros. For example,

\[ 75 \div 10^4 = 0.0075 \]
\[ 2.04 \div 10^5 = 0.0000204 \]
\[ 6.78 \div 10^{-3} = 6780 \]
\[ 0.08 \div 10^{-4} = 800 \]

When doing the next exercise, remember:

\[ 10^000 = 10 \times 10 \times 10 \times 10 = 10^4 \]
\[ 1 = \frac{10}{1} = 10^{-1} \]
\[ 1000 = 10 \times 10 \times 10 = 10^3 \]
\[ 0.1 = \frac{1}{10} = 10^{-1} \]
\[ 100 = 10 \times 10 = 10^2 \]
\[ 0.01 = \frac{1}{100} = 10^{-2} \]
\[ 10 = 10 = 10^1 \]
\[ 0.001 = \frac{1}{1000} = 10^{-3} \]

Write down the value of each of the following.

\[ a \ 3.1 \times 10 \]
\[ b \ 3.1 \times 100 \]
\[ c \ 3.1 \times 1000 \]
\[ d \ 3.1 \times 10000 \]

\[ a \ 6.5 \times 10 \]
\[ b \ 6.5 \times 10^2 \]
\[ c \ 6.5 \times 10^3 \]
\[ d \ 6.5 \times 10^4 \]

\[ a \ 3.1 \div 10 \]
\[ b \ 3.1 \div 100 \]
\[ c \ 3.1 \div 1000 \]
\[ d \ 3.1 \div 10000 \]

\[ a \ 6.5 \div 10 \]
\[ b \ 6.5 \div 10^2 \]
\[ c \ 6.5 \div 10^3 \]
\[ d \ 6.5 \div 10^4 \]

Evaluate the following.

\[ a \ 2.5 \times 100 \]
\[ b \ 3.45 \times 10 \]
\[ c \ 4.67 \times 1000 \]
\[ d \ 34.6 \times 10 \]

\[ a \ 20.789 \times 10 \]
\[ b \ 56.78 \times 1000 \]
\[ c \ 2.46 \times 10^2 \]
\[ d \ 0.076 \times 10 \]

\[ a \ 0.999 \times 10^6 \]
\[ b \ 234.56 \times 10^2 \]
\[ c \ 98.7654 \times 10^3 \]
\[ d \ 43.23 \times 10^6 \]

\[ a \ 0.003 \times 4578 \times 10^5 \]
\[ b \ 0.0006 \times 10^7 \]
\[ c \ 0.0057 \times 10^4 \]
\[ d \ 56.0045 \times 10^4 \]

Evaluate the following.

\[ a \ 2.5 \times 100 \]
\[ b \ 3.45 \times 10 \]
\[ c \ 4.67 \times 1000 \]
\[ d \ 34.6 \times 10 \]

\[ a \ 20.789 \div 100 \]
\[ b \ 56.78 \div 1000 \]
\[ c \ 2.46 \div 10^2 \]
\[ d \ 0.076 \div 10 \]

\[ a \ 0.999 \times 10^6 \]
\[ b \ 234.56 \times 10^2 \]
\[ c \ 98.7654 \times 10^3 \]
\[ d \ 43.23 \times 10^6 \]

\[ a \ 0.003 \times 4578 \div 10^5 \]
\[ b \ 0.0006 \div 10^7 \]
\[ c \ 0.0057 \div 10^4 \]
\[ d \ 56.0045 \div 10^4 \]

Without using a calculator, work out the following.

\( a \) \( 2.3 \times 10^2 \)  
\( b \) \( 5.789 \times 10^5 \)  
\( c \) \( 4.79 \times 10^3 \)  
\( d \) \( 5.7 \times 10^7 \)  
\( e \) \( 2.16 \times 10^2 \)  
\( f \) \( 1.05 \times 10^4 \)  
\( g \) \( 3.2 \times 10^{-4} \)  
\( h \) \( 9.87 \times 10^1 \) 

Which of these statements is true about the numbers in question 7?

\( a \) The first part is always a number between 1 and 10.
\( b \) There is always a multiplication sign in the middle of the expression.
\( c \) There is always a power of 10 at the end.
\( d \) Calculator displays sometimes show numbers in this form.

**Standard form**

**Standard form** is also known as standard index form or SI form. On calculators, it is usually called scientific notation.

Standard form is a way of writing very large and very small numbers using powers of 10. In this form, a number is given a value between 1 and 10 multiplied by a power of 10. That is,

\[ a \times 10^n \quad \text{where} \quad 1 < a < 10, \quad \text{and} \quad n \text{ is a whole number} \]

Follow through these examples to see how numbers are written in standard form.

\[
\begin{align*}
52 &= 5.2 \times 10^1 \\
73 &= 7.3 \times 10^1 \\
625 &= 6.25 \times 10^2 & \text{The numbers in bold are in standard form.} \\
389 &= 3.89 \times 10^3 \\
3147 &= 3.147 \times 10^3
\end{align*}
\]

When writing a number in this way, two rules must always be followed.

- The first part must be a number between 1 and 10 (1 is allowed but 10 isn’t).
- The second part must be a whole number (negative or positive) power of 10. Note that we would not normally write the power 1.

**Standard form on a calculator**

A number such as 123 000 000 000 is obviously difficult to key into a calculator. Instead, you enter it in standard form (assuming you are using a scientific calculator):

\[ 123 \ 000 \ 000 \ 000 = 1.23 \times 10^{11} \]
The key strokes to enter this into your calculator will be

1 2 3 EXP 1 1 (On some calculators EXP is EE.)

Your calculator display should now show

1.23 or 1.23

Be careful when you get an answer like this on your calculator. It needs to be written properly in standard form with \( \times \) 10, not copied exactly as shown on the calculator display.

**Standard form of numbers less than 1**

These numbers are written in standard form. Make sure that you understand how they are formed.

- **a** 0.4 = 4 \( \times \) 10\(^{-1} \)
- **b** 0.05 = 5 \( \times \) 10\(^{-2} \)
- **c** 0.007 = 7 \( \times \) 10\(^{-3} \)
- **d** 0.123 = 1.23 \( \times \) 10\(^{-1} \)
- **e** 0.00765 = 7.65 \( \times \) 10\(^{-3} \)
- **f** 0.9804 = 9.804 \( \times \) 10\(^{-1} \)
- **g** 0.0098 = 9.8 \( \times \) 10\(^{-3} \)
- **h** 0.000 0078 = 7.8 \( \times \) 10\(^{-6} \)

On a calculator you would enter 1.23 \( \times \) 10\(^{-6} \), for example, as

1 . 2 3 \( \times \) 10 \( ^{-6} \)

or 1 . 2 3 \( \times \) 6

How you enter such numbers will depend on your type of calculator. Try some of the numbers **a** to **h** (above) to see what happens.

**EXERCISE 10G → ANSWERS**

1. Write down the value of each of the following.
   - **a** 3.1 \( \times \) 0.1
   - **b** 3.1 \( \times \) 0.01
   - **c** 3.1 \( \times \) 0.001
   - **d** 3.1 \( \times \) 0.0001

2. Write down the value of each of the following.
   - **a** 6.5 \( \times \) 10\(^{-1} \)
   - **b** 6.5 \( \times \) 10\(^{-2} \)
   - **c** 6.5 \( \times \) 10\(^{-3} \)
   - **d** 6.5 \( \times \) 10\(^{-4} \)

3. a What is the largest number you can enter into your calculator?
   - b What is the smallest number you can enter into your calculator?

4. Work out the value of each of the following.
   - **a** 3.1 ÷ 0.1
   - **b** 3.1 ÷ 0.01
   - **c** 3.1 ÷ 0.001
   - **d** 3.1 ÷ 0.0001

5. Work out the value of each of the following.
   - **a** 6.5 \( \times \) 10\(^{-1} \)
   - **b** 6.5 \( \times \) 10\(^{-2} \)
   - **c** 6.5 \( \times \) 10\(^{-3} \)
   - **d** 6.5 \( \times \) 10\(^{-4} \)

Write these numbers out in full.

a. \(2.5 \times 10^2\)
b. \(3.45 \times 10\)
c. \(4.67 \times 10^{-3}\)
d. \(3.46 \times 10\)
e. \(2.0789 \times 10^{-2}\)
f. \(5.67 \times 10^1\)
g. \(4.67 \times 10^{-3}\)
h. \(7.6 \times 10^3\)
i. \(8.97 \times 10^5\)
j. \(8.65 \times 10^{-3}\)
k. \(6 \times 10^7\)
l. \(5.67 \times 10^{-4}\)

Write these numbers in standard form.

a. \(250\)
b. \(0.345\)
c. \(46700\)
d. \(340000000\)
e. \(2078000000\)
f. \(0.0005678\)
g. \(2460\)
h. \(0.076\)
i. \(0.00076\)
j. \(0.999\)
k. \(234.56\)
l. \(98.7654\)
m. \(0.0006\)
n. \(0.00567\)
o. \(56.0045\)

In questions 8 to 10, write the numbers given in each question in standard form.

One year, 27,797 runners completed the New York marathon.
The largest number of dominoes ever toppled by one person is 303,621, although 30 people set up and toppled 4,002,136.
The asteroid Phaethon comes within 12,980,000 miles of the sun, whilst the asteroid Pholus, at its furthest point, is a distance of 2,997 million miles from the earth. The closest an asteroid ever came to Earth recently was 93,000 miles from the planet.

Calculating with standard form

Calculations involving very large or very small numbers can be done more easily using standard form. In these examples, we work out the area of a pixel on a computer screen, and how long it takes light to reach the Earth from a distant star.

**EXAMPLE 3**

A pixel on a computer screen is \(2 \times 10^{-2}\) cm long by \(7 \times 10^{-5}\) cm wide.

What is the area of the pixel?

The area is given by length times width:

\[
\text{Area} = 2 \times 10^{-2} \text{ cm} \times 7 \times 10^{-5} \text{ cm}
\]

\[
= (2 \times 7) \times (10^{-2} \times 10^{-5}) \text{ cm}^2 = 14 \times 10^{-5} \text{ cm}^2
\]

Note that you multiply the numbers and add the powers of \(10\). (You should not need to use a calculator to do this calculation.) The answer is not in standard form as the first part is not between 1 and 10, so we have to change it to standard form.

\[
\text{Area} = 14 \times 10^{-5} \text{ cm}^2 = 1.4 \times 10^{-4} \text{ cm}^2
\]
EXAMPLE 4

The star Betelgeuse is $1.8 \times 10^{15}$ miles from Earth. Light travels at $1.86 \times 10^5$ miles per second.

a How many seconds does it take light to travel from Betelgeuse to Earth? Give your answer in standard form.

Time = distance ÷ speed = $1.8 \times 10^{15}$ miles ÷ $1.86 \times 10^5$ miles per second

= $(1.8 \div 1.86) \times (10^{15} ÷ 10^5)$ seconds

= $0.967 741 955 \times 10^{10}$ seconds

Note that you divide the numbers and subtract the powers of 10. To change the answer to standard form, first round it off, which gives $0.97 \times 10^{10} = 9.7 \times 10^9$ seconds

b To convert from seconds to years, you have to divide first by 3600 to get to hours, then by 24 to get to days, and finally by 365 to get to years.

$9.7 \times 10^9 ÷ (3600 \times 24 \times 365) = 307.6$ years

EXERCISE 10H

These numbers are not in standard form. Write them in standard form.

a $56.7 \times 10^2$

c $34.6 \times 10^{-2}$

d $0.07 \times 10^{-2}$

f $2 \times 10^5$

g $2 \times 10^3 \times 35$

h $160 \times 10^{-2}$

i $23$ million

j $0.003 \times 10^{-3}$

k $25.6 \times 10^5$

l $16 \times 10^2 ÷ 3 \times 10^3$

m $2 \times 10^4 \times 56 \times 10^{-4}$

n $18 \times 10^2 ÷ 3 \times 10^3$

o $56 \times 10^3 ÷ 2 \times 10^{-2}$

Work out the following. Give your answers in standard form.

a $2 \times 10^4 \times 5.4 \times 10^5$

b $2 \times 10^{-4} \times 5.4 \times 10^3$

c $2 \times 10^4 \times 6 \times 10^4$

d $2 \times 10^{-4} \times 5.4 \times 10^3$

e $1.6 \times 10^3 \times 4 \times 10^4$

f $2 \times 10^4 \times 6 \times 10^{-4}$

g $7.2 \times 10^{-3} \times 4 \times 10^5$

h $(5 \times 10^5)^2$

i $(2 \times 10^{-3})^3$

Work out the following. Give your answers in standard form, rounding off to an appropriate degree of accuracy where necessary.

a $2.1 \times 10^4 \times 5.4 \times 10^3$

b $1.6 \times 10^3 \times 3.8 \times 10^3$

c $2.4 \times 10^4 \times 6.6 \times 10^4$

d $7.3 \times 10^6 \times 5.4 \times 10^3$

e $(3.1 \times 10^5)^2$

f $(6.8 \times 10^4)^2$

g $5.7 \times 10 \times 3.7 \times 10$

h $1.9 \times 10^{-2} \times 1.9 \times 10^9$

i $5.9 \times 10^1 \times 2.5 \times 10^{-2}$

j $5.2 \times 10^3 \times 2.2 \times 10^2 \times 3.1 \times 10^3$

k $1.8 \times 10^2 \times 3.6 \times 10^3 \times 2.4 \times 10^{-2}$

Work out the following. Give your answers in standard form.

a $5.4 \times 10^4 ÷ 2 \times 10^3$

b $4.8 \times 10^2 ÷ 3 \times 10^4$

c $1.2 \times 10^4 ÷ 6 \times 10^4$

d $2 \times 10^{-4} ÷ 5 \times 10^3$

e $1.8 \times 10^4 \div 9 \times 10^{-2}$

f $\sqrt{(36 \times 10^{-3})}$

g $5.4 \times 10^{-3} ÷ 2.7 \times 10^2$

h $1.8 \times 10^6 ÷ 3.6 \times 10^3$

i $5.6 \times 10^3 ÷ 2.8 \times 10^2$
Work out the following. Give your answers in standard form, rounding off to an appropriate degree of accuracy where necessary.

\[a \quad 2.7 \times 10^4 \div 5 \times 10^2 \quad b \quad 2.3 \times 10^4 \div 8 \times 10^6 \quad c \quad 3.2 \times 10^{-1} \div 2.8 \times 10^{-1} \]

\[d \quad 2.6 \times 10^{-6} \div 4.1 \times 10^3 \quad e \quad \sqrt{(8 \times 10^5)} \quad f \quad \sqrt{(30 \times 10^{-6})} \]

\[g \quad 5.3 \times 10^3 \times 2.3 \times 10^2 \div 2.5 \times 10^3 \quad h \quad 1.8 \times 10^2 \times 3.1 \times 10^3 \div 6.5 \times 10^{-2} \]

A typical adult has about 20,000,000,000,000 red corpuscles. Each red corpuscle weighs about 0.000,000,000,1 gram. Write both of these numbers in standard form and work out the total mass of red corpuscles in a typical adult.

If a man puts 1 grain of rice on the first square of a chess board, 2 on the second square, 4 on the third, 8 on the fourth and so on,

\[a \quad \text{how many grains of rice will he put on the 64th square of the board?} \]

\[b \quad \text{how many grains of rice will there be altogether?} \]

Give your answers in standard form.

The surface area of the Earth is approximately 2 \times 10^8 square miles. The surface area of the earth covered by water is approximately 1.4 \times 10^8 square miles.

\[a \quad \text{Calculate the surface area of the Earth not covered by water. Give your answer in standard form.} \]

\[b \quad \text{What percentage of the Earth's surface is not covered by water?} \]

The moon is a sphere with a radius of 1.080 \times 10^3 miles. The formula for working out the surface area of a sphere is

\[\text{Surface area} = 4\pi r^2\]

Calculate the surface area of the moon.

Evaluate \( \frac{E}{M} \) when \( E = 1.5 \times 10^3 \) and \( M = 3 \times 10^{-2} \), giving your answer in standard form.

Work out the value of \( \frac{3.2 \times 10^7}{1.4 \times 10^2} \), giving your answer in standard form, correct to two significant figures.

In 2005, British Airways carried 23 million passengers. Of these, 70% passed through Heathrow Airport. On average, each passenger carried 19.7 kg of luggage. Calculate the total weight of the luggage carried by these passengers.

Many people withdraw money from their banks by using hole-in-the-wall machines. Each day there are eight million withdrawals from 32,000 machines. What is the average number of withdrawals per machine?

The mass of Saturn is 5.686 \times 10^{26} tonnes. The mass of the Earth is 6.04 \times 10^{21} tonnes. How many times heavier is Saturn than the Earth? Give your answer in standard form to a suitable degree of accuracy.
Rational decimal numbers

A fraction, also known as a rational number, can be expressed as a decimal which is either a terminating decimal or a recurring decimal.

A terminating decimal contains a finite number of digits (decimal places). For example, changing $\frac{3}{16}$ into a decimal gives 0.1875 exactly.

A recurring decimal contains a digit or a block of digits that repeats. For example, changing $\frac{5}{9}$ into a decimal gives 0.5555 ..., while changing $\frac{14}{27}$ into a decimal gives 0.518 518 5 ... with the recurring block 518.

Recurring decimals are indicated by a dot placed over the first and last digits in the recurring block. For example, 0.5555 ... becomes $0.5\cdot$, 0.518 518 5 ... becomes $0.5\cdot18\cdot$, and 0.583 33 becomes $0.583\cdot$.

Converting decimals into fractions

Terminating decimals
When converting a terminating decimal, the numerator of the fraction is formed from the decimal, and its denominator is given by 10, 100 or 1000, depending on the number of decimal places. Because the terminating decimal ends at a specific decimal place, we know the place value at which the numerator ends. For example,

\[
0.7 = \frac{7}{10} \\
2.34 = 2 \frac{34}{100} = 2 \frac{17}{50}
\]

\[
0.045 = \frac{45}{1000} = \frac{9}{200} \\
0.625 = \frac{625}{1000} = \frac{5}{8}
\]

Recurring decimals
If a fraction does not give a terminating decimal, it will give a recurring decimal. You already know that $\frac{1}{3} = 0.333 ... = 0.3$. This means that the 3s go on forever and the decimal never ends. To check whether a fraction is a recurring decimal, you usually have to use a calculator to divide the numerator by the denominator. Use a calculator to check the following recurring decimals. (Note that calculators round off the last digit so it may not always be a true recurring decimal in the display.)
To convert a recurring decimal to a fraction, you have to multiply the decimal by a suitable power of 10, and then perform a subtraction. These examples demonstrate the method.

**EXAMPLE 5**

Convert $0.\bar{7}$ to a fraction.

Let $x$ be the fraction. Then

\[
x = 0.777\ldots \quad (1)
\]

Multiply (1) by 10

\[10x = 7.777\ldots \quad (2)
\]

Subtract (2) – (1)

\[9x = 7
\]

\[\Rightarrow x = \frac{7}{9}
\]

**EXAMPLE 6**

Convert $0.\bar{5}6\bar{4}$ to a fraction.

Let $x$ be the fraction. Then

\[
x = 0.564\ 564\ 564\ldots \quad (1)
\]

Multiply (1) by 1000

\[1000x = 564.564\ 564\ 564\ldots \quad (2)
\]

Subtract (2) – (1)

\[999x = 564
\]

\[\Rightarrow x = \frac{564}{999} = \frac{188}{333}
\]

As a general rule multiply by 10 if one digit recurs, multiply by 100 if two digits recur, multiply by 1000 if three digits recur, and so on.

**Reciprocals**

The **reciprocal** of a number is the number divided into 1. So the reciprocal of 2 is $1 \div 2 = \frac{1}{2}$ or 0.5.

Reciprocals of fractions are quite easy to find as you just have to turn the fraction upside down. For example, the reciprocal of $\frac{2}{3}$ is $\frac{3}{2}$. 
Work out each of these fractions as a decimal. Give them as terminating decimals or recurring decimals as appropriate.

\[ \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \frac{1}{6}, \frac{1}{7}, \frac{1}{8}, \frac{1}{9}, \frac{1}{10}, \frac{1}{11}, \frac{1}{12} \]

There are several patterns to be found in recurring decimals. For example,

\[ \frac{1}{7} = 0.142857142857... \]
\[ \frac{2}{7} = 0.285714285714... \]
\[ \frac{3}{7} = 0.428571428571... \]
and so on.

a Write down the decimals for \( \frac{1}{7}, \frac{2}{7}, \frac{3}{7} \) to 24 decimal places.
b What do you notice?

Work out the ninths as recurring decimals, that is \( \frac{1}{9}, \frac{2}{9}, \frac{3}{9} \) and so on, up to \( \frac{8}{9} \).

Describe any patterns that you notice.

Work out the elevenths as recurring decimals, that is \( \frac{1}{11}, \frac{2}{11}, \frac{3}{11} \) and so on, up to \( \frac{10}{11} \).

Describe any patterns that you notice.

Write each of these fractions as a decimal. Use this to write the list in order of size, smallest first.

\[ \frac{1}{6}, \frac{1}{7}, \frac{1}{8}, \frac{1}{9}, \frac{1}{10}, \frac{1}{11} \]

Write each of the following as a fraction with a denominator of 120. Use this to put them in order of size, smallest first.

\[ \frac{1}{60}, \frac{1}{70}, \frac{1}{80}, \frac{1}{90}, \frac{1}{100}, \frac{1}{110} \]

Convert each of these terminating decimals to a fraction.

a 0.125 b 0.34 c 0.725 d 0.3125

a 0.89 e 0.05 f 2.35 g 0.21875

Use a calculator to work out the reciprocals of the following values.

a 12 b 16 c 20 d 25 e 50

Write down the reciprocals of the following fractions.

a \( \frac{1}{4} \) b \( \frac{1}{6} \) c \( \frac{1}{8} \) d \( \frac{7}{10} \)

e \( \frac{11}{20} \) f \( \frac{4}{15} \)
a Work out the fractions and their reciprocals from question 9 as decimals. Write them as terminating decimals or recurring decimals as appropriate.

b Is it always true that a fraction that gives a terminating decimal has a reciprocal that gives a recurring decimal?

Multiply together the fractions and their reciprocals from question 9. What results do you get every time?

\[ x = 0.242424 \ldots \]

a What is 100x?

b By subtracting the original value from your answer to part a, work out the value of 99x.

c What is x as a fraction?

Convert each of these recurring decimals to a fraction.

\[ a \quad 0.8 \quad b \quad 0.3\overline{4} \quad c \quad 0.4\overline{5} \quad d \quad 0.5\overline{6} \]

\[ e \quad 0.4 \quad f \quad 0.0\overline{4} \quad g \quad 0.1\overline{4} \quad h \quad 0.04\overline{5} \]

\[ i \quad 2.\overline{7} \quad j \quad 7.\overline{63} \quad k \quad 3.\overline{3} \quad l \quad 2.0\overline{6} \]

a \( \frac{1}{3} \) is a recurring decimal. \( \left( \frac{1}{3} \right)^2 = \frac{1}{9} \) is also a recurring decimal.

Is it true that when you square any fraction that is a recurring decimal, you get another fraction that is also a recurring decimal? Try this with at least four numerical examples before you make a decision.

b \( \frac{1}{4} \) is a terminating decimal. \( \left( \frac{1}{4} \right)^2 = \frac{1}{16} \) is also a terminating decimal.

Is it true that when you square any fraction that is a terminating decimal, you get another fraction that is also a terminating decimal? Try this with at least four numerical examples before you make a decision.

c What type of fraction do you get when you multiply a fraction that gives a recurring decimal by another fraction that gives a terminating decimal? Try this with at least four numerical examples before you make a decision.

a Convert the recurring decimal 0.\( \overline{9} \) to a fraction.

b Prove that 0.49 is equal to 0.5.
It is useful at higher levels of mathematics to be able to work with surds, which are roots of numbers written as, for example,
\[ \sqrt{2}, \sqrt{5}, \sqrt{15}, \sqrt{9}, \sqrt{3}, \sqrt{10} \]

Four general rules governing surds (which you can verify yourself by taking numerical examples) are:
\[ \sqrt{a} \times \sqrt{b} = \sqrt{ab} \]
\[ C\sqrt{a} \times D\sqrt{b} = CD\sqrt{ab} \]
\[ \sqrt{a} \div \sqrt{b} = \frac{\sqrt{a}}{\sqrt{b}} \]
\[ C\sqrt{a} \div D\sqrt{b} = \frac{C\sqrt{a}}{D\sqrt{b}} \]

For example,
\[ \sqrt{2} \times \sqrt{2} = 2 \]
\[ \sqrt{2} \times \sqrt{10} = \sqrt{20} = \sqrt{4 \times 5} = \sqrt{4} \times \sqrt{5} = 2\sqrt{5} \]
\[ \sqrt{2} \times \sqrt{3} = \sqrt{6} \]
\[ \sqrt{6} \times \sqrt{15} = \sqrt{90} = \sqrt{9} \times \sqrt{10} = 3\sqrt{10} \]
\[ \sqrt{2} \times \sqrt{8} = \sqrt{16} = 4 \]
\[ \sqrt{3} \times \sqrt{3} \]

Simplify each of the following. Leave your answers in surd form.

1. Simplify each of the following. Leave your answers in surd form.
   a. \( \sqrt{2} \times \sqrt{3} \)
   b. \( \sqrt{5} \times \sqrt{3} \)
   c. \( \sqrt{2} \times \sqrt{2} \)
   d. \( \sqrt{2} \times \sqrt{8} \)
   e. \( \sqrt{5} \times \sqrt{8} \)
   f. \( \sqrt{3} \times \sqrt{3} \)
   g. \( \sqrt{6} \times \sqrt{2} \)
   h. \( \sqrt{7} \times \sqrt{3} \)
   i. \( \sqrt{2} \times \sqrt{7} \)
   j. \( \sqrt{2} \times \sqrt{18} \)
   k. \( \sqrt{6} \times \sqrt{6} \)
   l. \( \sqrt{5} \times \sqrt{6} \)

2. Simplify each of the following. Leave your answers in surd form.
   a. \( \sqrt{12} \div \sqrt{3} \)
   b. \( \sqrt{15} \div \sqrt{3} \)
   c. \( \sqrt{12} \div \sqrt{2} \)
   d. \( \sqrt{24} \div \sqrt{8} \)
   e. \( \sqrt{40} \div \sqrt{8} \)
   f. \( \sqrt{3} \div \sqrt{3} \)
   g. \( \sqrt{6} \div \sqrt{2} \)
   h. \( \sqrt{21} \div \sqrt{3} \)
   i. \( \sqrt{28} \div \sqrt{7} \)
   j. \( \sqrt{48} \div \sqrt{8} \)
   k. \( \sqrt{6} \div \sqrt{6} \)
   l. \( \sqrt{54} \div \sqrt{6} \)

3. Simplify each of the following. Leave your answers in surd form.
   a. \( \sqrt{2} \times \sqrt{3} \times \sqrt{2} \)
   b. \( \sqrt{5} \times \sqrt{3} \times \sqrt{15} \)
   c. \( \sqrt{2} \times \sqrt{2} \times \sqrt{8} \)
   d. \( \sqrt{2} \times \sqrt{8} \times \sqrt{3} \)
   e. \( \sqrt{5} \times \sqrt{8} \times \sqrt{8} \)
   f. \( \sqrt{3} \times \sqrt{3} \times \sqrt{3} \)
   g. \( \sqrt{6} \times \sqrt{2} \times \sqrt{48} \)
   h. \( \sqrt{7} \times \sqrt{3} \times \sqrt{3} \)
   i. \( \sqrt{2} \times \sqrt{7} \times \sqrt{2} \)
   j. \( \sqrt{2} \times \sqrt{18} \times \sqrt{5} \)
   k. \( \sqrt{6} \times \sqrt{6} \times \sqrt{3} \)
   l. \( \sqrt{5} \times \sqrt{6} \times \sqrt{30} \)
4. Simplify each of the following. Leave your answers in surd form.
   a. \( \sqrt{2} \times \sqrt{3} \div \sqrt{2} \)
   b. \( \sqrt{5} \times \sqrt{3} \div \sqrt{15} \)
   c. \( \sqrt{32} \times \sqrt{2} \)
   d. \( \sqrt{2} \times \sqrt{8} \)
   e. \( \sqrt{5} \times \sqrt{8} \)
   f. \( \sqrt{3} \times \sqrt{3} \)
   g. \( \sqrt{8} \times \sqrt{12} \)
   h. \( \sqrt{7} \times \sqrt{3} \)
   i. \( \sqrt{2} \times \sqrt{7} \)
   j. \( \sqrt{2} \times \sqrt{18} \)
   k. \( \sqrt{6} \times \sqrt{6} \)
   l. \( \sqrt{5} \times \sqrt{6} \)

5. Simplify each of these expressions.
   a. \( a \times a \)
   b. \( a \div a \)
   c. \( a \times a \div a \)

6. Simplify each of the following surds into the form \( a \sqrt{b} \).
   a. \( \sqrt{18} \)
   b. \( \sqrt{24} \)
   c. \( \sqrt{12} \)
   d. \( \sqrt{50} \)
   e. \( \sqrt{8} \)
   f. \( \sqrt{27} \)
   g. \( \sqrt{48} \)
   h. \( \sqrt{75} \)
   i. \( \sqrt{45} \)
   j. \( \sqrt{63} \)
   k. \( \sqrt{32} \)
   l. \( \sqrt{200} \)
   m. \( \sqrt{1000} \)
   n. \( \sqrt{250} \)
   o. \( \sqrt{98} \)
   p. \( \sqrt{243} \)

7. Simplify each of these.
   a. \( 2\sqrt{18} \times 3 \sqrt{2} \)
   b. \( 4\sqrt{24} \times 2 \sqrt{5} \)
   c. \( 3\sqrt{12} \times 3 \sqrt{3} \)
   d. \( 2\sqrt{8} \times 2 \sqrt{8} \)
   e. \( 2\sqrt{27} \times 4 \sqrt{8} \)
   f. \( 2\sqrt{48} \times 3 \sqrt{8} \)
   g. \( 2\sqrt{45} \times 3 \sqrt{3} \)
   h. \( 2\sqrt{63} \times 2 \sqrt{7} \)
   i. \( 2\sqrt{32} \times 4 \sqrt{2} \)
   j. \( \sqrt{1000} \times \sqrt{10} \)
   k. \( \sqrt{250} \times \sqrt{10} \)
   l. \( 2\sqrt{98} \times 2 \sqrt{2} \)

8. Simplify each of these.
   a. \( 4\sqrt{2} \times 5 \sqrt{3} \)
   b. \( 2\sqrt{5} \times 3 \sqrt{3} \)
   c. \( 4\sqrt{2} \times 3 \sqrt{2} \)
   d. \( 2\sqrt{2} \times 2 \sqrt{8} \)
   e. \( 2\sqrt{5} \times 3 \sqrt{8} \)
   f. \( 3\sqrt{3} \times 2 \sqrt{3} \)
   g. \( 2\sqrt{6} \times 5 \sqrt{2} \)
   h. \( 5\sqrt{7} \times 2 \sqrt{3} \)
   i. \( 2\sqrt{2} \times 3 \sqrt{7} \)
   j. \( 2\sqrt{2} \times 3 \sqrt{18} \)
   k. \( 2\sqrt{6} \times 2 \sqrt{6} \)
   l. \( 4\sqrt{5} \times 3 \sqrt{6} \)

9. Simplify each of these.
   a. \( 6\sqrt{12} \div 2 \sqrt{3} \)
   b. \( 3\sqrt{15} \div \sqrt{3} \)
   c. \( 6\sqrt{12} \div \sqrt{2} \)
   d. \( 4\sqrt{24} \div 2 \sqrt{8} \)
   e. \( 12\sqrt{40} \div 3 \sqrt{8} \)
   f. \( 5\sqrt{3} \div \sqrt{3} \)
   g. \( 14\sqrt{6} \div 2 \sqrt{2} \)
   h. \( 4\sqrt{21} \div 2 \sqrt{3} \)
   i. \( 9\sqrt{28} \div 3 \sqrt{7} \)
   j. \( 12\sqrt{56} \div 6 \sqrt{8} \)
   k. \( 25\sqrt{6} \div 5 \sqrt{6} \)
   l. \( 32\sqrt{54} \div 4 \sqrt{6} \)

10. Simplify each of these.
    a. \( 4\sqrt{2} \times \sqrt{3} \div 2 \sqrt{2} \)
    b. \( 4\sqrt{5} \times \sqrt{3} \div \sqrt{15} \)
    c. \( 2\sqrt{32} \times 3 \sqrt{2} \div 2 \sqrt{8} \)
    d. \( 6\sqrt{2} \div 2 \sqrt{8} \times \sqrt{3} \)
    e. \( 3\sqrt{5} \times 4 \sqrt{8} \div 2 \sqrt{8} \)
    f. \( 12\sqrt{3} \div 4 \sqrt{3} \div 2 \sqrt{3} \)
    g. \( 3\sqrt{8} \div 3 \sqrt{12} \div 3 \sqrt{48} \)
    h. \( 4\sqrt{7} \div 2 \sqrt{3} \div 8 \sqrt{3} \)
    i. \( 15\sqrt{2} \div 2 \sqrt{7} \div 3 \sqrt{2} \)
    j. \( 8\sqrt{2} \div 2 \sqrt{18} \div 4 \sqrt{3} \)
    k. \( 5\sqrt{6} \div 5 \sqrt{6} \div 5 \sqrt{3} \)
    l. \( 2\sqrt{5} \div 3 \sqrt{6} \div 3 \sqrt{30} \)

11. Simplify each of these expressions.
    a. \( a \sqrt{b} \times c \sqrt{b} \)
    b. \( a \sqrt{b} \div c \sqrt{b} \)
    c. \( a \sqrt{b} \times c \sqrt{b} \div a \sqrt{b} \)
12. Find the value of $a$ that makes each of these surds true.

- $\sqrt{5} \times \sqrt{a} = 10$
- $\sqrt{6} \times \sqrt{a} = 12$
- $\sqrt{10} \times 2\sqrt{a} = 20$
- $2\sqrt{6} \times 3\sqrt{a} = 72$
- $2\sqrt{a} \times \sqrt{a} = 6$
- $3\sqrt{a} \times 3\sqrt{a} = 54$

13. Simplify the following.

- $\left(\frac{\sqrt{3}}{2}\right)^2$
- $\left(\frac{5}{\sqrt{3}}\right)^2$
- $\left(\frac{\sqrt{5}}{4}\right)^2$
- $\left(\frac{6}{\sqrt{3}}\right)^2$
- $\left(\frac{\sqrt{8}}{2}\right)^2$

14. The following rules are not true. Try some numerical examples to show this.

- $\sqrt{a + b} = \sqrt{a} + \sqrt{b}$
- $\sqrt{a - b} = \sqrt{a} - \sqrt{b}$

Calculating with surds

The following two examples show how surds can be used in solving problems.

**EXAMPLE 7**

In the right-angled triangle $ABC$, the side $BC$ is $\sqrt{6}$ cm and the side $AC$ is $\sqrt{18}$ cm.

Calculate the length of $AB$. Leave your answer in surd form.

Using Pythagoras’ theorem

$$AC^2 + BC^2 = AB^2$$

$$(\sqrt{18})^2 + (\sqrt{6})^2 = 18 + 6 = 24$$

$\Rightarrow AB = \sqrt{24}$ cm

$$= 2\sqrt{6}$$ cm

**EXAMPLE 8**

Calculate the area of a square with a side of $2 + \sqrt{3}$ cm. Give your answer in the form $a + b\sqrt{3}$.

Area $= (2 + \sqrt{3})^2$ cm$^2$

$= (2 + \sqrt{3})(2 + \sqrt{3})$ cm$^2$

$= 4 + 2\sqrt{3} + 2\sqrt{3} + 3$ cm$^2$

$= 7 + 4\sqrt{3}$ cm$^2$
Rationalising the denominator

It is not good mathematical practice to leave a surd on the bottom of an expression. To get rid of it, we make the denominator into a whole number, which we do by multiplying by the appropriate square root. This means that we must also multiply the top of the expression by the same root. The following example shows you what to do.

**EXAMPLE 9**

Rationalise the denominator of \( \frac{1}{\sqrt{3}} \) and \( \frac{2\sqrt{3}}{\sqrt{8}} \).

\( a \) Multiply the top and the bottom by \( \sqrt{3} \):

\[
\frac{1 \times \sqrt{3}}{\sqrt{3} \times \sqrt{3}} = \frac{\sqrt{3}}{3}
\]

\( b \) Multiply the top and the bottom by \( \sqrt{8} \):

\[
\frac{2\sqrt{3} \times \sqrt{8}}{\sqrt{8} \times \sqrt{8}} = \frac{2\sqrt{24}}{\sqrt{8}} = \frac{4\sqrt{6}}{2} = \sqrt{6}
\]

**EXERCISE 10K**

1. Show that:
   \( a \) \((2 + \sqrt{3})(1 + \sqrt{3}) = 5 + 3\sqrt{3} \)
   \( b \) \((1 + \sqrt{2})(2 + \sqrt{3}) = 2 + 2\sqrt{2} + \sqrt{3} + \sqrt{6} \)
   \( c \) \((4 - \sqrt{3})(4 + \sqrt{3}) = 13 \)

2. Expand and simplify where possible.
   \( a \) \(\sqrt{3}(2 - \sqrt{3}) \)
   \( b \) \(\sqrt{2}(3 - 4\sqrt{2}) \)
   \( c \) \(\sqrt{5}(2\sqrt{5} + 4) \)
   \( d \) \(3\sqrt{7}(4 - 2\sqrt{7}) \)
   \( e \) \(3\sqrt{2}(5 - 2\sqrt{8}) \)
   \( f \) \(\sqrt{3}(\sqrt{27} - 1) \)

3. Expand and simplify where possible.
   \( a \) \((1 + \sqrt{3})(3 - \sqrt{3}) \)
   \( b \) \((2 + \sqrt{5})(3 - \sqrt{5}) \)
   \( c \) \((1 - \sqrt{2})(3 + 2\sqrt{2}) \)
   \( d \) \((3 - 2\sqrt{7})(4 + 3\sqrt{7}) \)
   \( e \) \((2 - 3\sqrt{5})(2 + 3\sqrt{5}) \)
   \( f \) \((\sqrt{3} + \sqrt{2})(\sqrt{3} + \sqrt{8}) \)
   \( g \) \((2 + \sqrt{5})^2 \)
   \( h \) \((1 - \sqrt{2})^2 \)
   \( i \) \((3 + \sqrt{2})^2 \)

4. Work out the missing lengths in each of these triangles, giving the answer in as simple a form as possible.
   
   **a** \( \sqrt{8} \) cm \( \sqrt{10} \) cm
   
   **b** \( \sqrt{22} \) cm \( \sqrt{10} \) cm
   
   **c** \( 2\sqrt{8} \) cm \( \sqrt{8} \) cm
5. Calculate the area of each of these rectangles, simplifying your answers where possible.

- **a**: \(1 + \sqrt{3}\) cm by \(2 - \sqrt{3}\) cm
- **b**: \(2 + \sqrt{10}\) cm by \(\sqrt{5}\) cm
- **c**: \(2\sqrt{3}\) cm by \(1 + \sqrt{27}\) cm

6. Rationalise the denominators of these expressions.

- **a**: \(\frac{1}{\sqrt{3}}\)
- **b**: \(\frac{1}{\sqrt{2}}\)
- **c**: \(\frac{1}{\sqrt{5}}\)
- **d**: \(\frac{1}{2\sqrt{3}}\)
- **e**: \(\frac{3}{\sqrt{3}}\)
- **f**: \(\frac{5}{\sqrt{2}}\)
- **g**: \(\frac{3\sqrt{2}}{\sqrt{18}}\)
- **h**: \(\frac{5\sqrt{3}}{\sqrt{6}}\)
- **i**: \(\frac{\sqrt{7}}{\sqrt{3}}\)
- **j**: \(\frac{1 + \sqrt{2}}{\sqrt{2}}\)
- **k**: \(\frac{2 - \sqrt{3}}{\sqrt{3}}\)
- **l**: \(\frac{5 + 2\sqrt{3}}{\sqrt{3}}\)

7. a. Expand and simplify the following.

- **i**: \((2 + \sqrt{3})(2 - \sqrt{3})\)
- **ii**: \((1 - \sqrt{5})(1 + \sqrt{5})\)
- **iii**: \((\sqrt{3} - 1)(\sqrt{3} + 1)\)
- **iv**: \((3\sqrt{2} + 1)(3\sqrt{2} - 1)\)
- **v**: \((2 - 4\sqrt{3})(2 + 4\sqrt{3})\)

b. What happens in the answers to part a? Why?

c. Rationalise the denominators of the following.

- **i**: \(\frac{5}{1 - \sqrt{5}}\)
- **ii**: \(\frac{2 + \sqrt{3}}{\sqrt{3} - 1}\)
A spaceship travelled for \(6 \times 10^3\) hours at a speed of \(8 \times 10^4\) km/h.

a Calculate the distance travelled by the spaceship. Give your answer in standard form.

One month an aircraft travelled \(2 \times 10^5\) km. The next month the aircraft travelled \(3 \times 10^4\) km.

b Calculate the total distance travelled by the aircraft in the two months. Give your answer as an ordinary number.

---

Express the recurring decimal 0.5333333... as a fraction. Give your answer in its simplest form.

Find values of \(a\) and \(b\) such that

\[(3 + \sqrt{5})(2 - \sqrt{5}) = a + b\sqrt{5}\]

The area of this rectangle is 40 cm\(^2\)

Find the value of \(x\). Give your answer in the form \(a\sqrt{b}\) where \(a\) and \(b\) are integers.

---

Expand and simplify as far as possible \((\sqrt{2} + 3)(\sqrt{2} - 1)\).

Show clearly that \(\frac{3}{\sqrt{6}} + \frac{\sqrt{6}}{3} = \frac{5}{\sqrt{6}}\)

Rationalise the denominator of \(\frac{4 + \sqrt{6}}{\sqrt{5}}\)

Simplify your answer fully.
A scientist is doing some research on the production and consumption of oil in the world. She looks at 10 oil producing countries and, for each country, finds the most recent figures on the country’s population, and its oil production and consumption, measured in barrels per day.

With these figures she calculates for each country the oil produced per person per year, and the oil consumed per person per year, then finds the difference (all to 1 decimal place).

She then ranks the countries from 1 to 10 (highest difference to lowest difference), to see which countries are using less than they produce, and which countries are using more than they produce.

She also calculates each country’s consumption as a percentage of its production (to the nearest 1%).

Help her complete the table and write a short paragraph on the results of the calculations.

<table>

GRADE YOURSELF

Able to write and calculate numbers written in index form
Able to multiply and divide numbers written in index form
Able to write numbers in standard form and use these in various problems
Know how to use the rules of indices for negative and fractional values
Able to convert recurring decimals to fractions
Able to simplify surds
Able to manipulate expressions containing surds and rationalise denominators
Able to solve problems using surds

What you should know now

- How to write numbers in standard form
- How to solve problems using numbers in standard form
- How to manipulate indices, both integer (positive and negative) and fractional
- How to compare fractions by converting them to decimals
- How to convert decimals into fractions
- What surds are and how to manipulate them
This chapter will show you ...

- how to calculate and use the mode, median, mean and range from frequency tables of discrete data
- how to decide which is the best average for different types of data
- how to recognise the modal class and calculate an estimate of the mean from frequency tables of grouped data
- how to draw frequency polygons and histograms
- how to calculate and use a moving average
- how to design questions for questionnaires and surveys

What you should already know

- How to work out the mean, mode, median and range of small sets of discrete data
- How to extract information from tables and diagrams

Quick check

1. The marks for 15 students in a maths test are 2, 3, 4, 5, 5, 6, 6, 7, 7, 7, 7, 7, 10
   
   a. What is the modal mark?
   
   b. What is the median mark?
   
   c. What is the range of the marks?
   
   d. What is the mean mark?
Average is a term we often use when describing or comparing sets of data. The average is also known as a measure of location. For example, we refer to the average rainfall in Britain, the average score of a batsman, an average weekly wage, the average mark in an examination. In each of these examples, we are representing the whole set of many values by just one single, typical value, which we call the average.

The idea of an average is extremely useful, because it enables us to compare one set of data with another set by comparing just two values – their averages.

There are several ways of expressing an average, but the most commonly used averages are the mode, the median and the mean.

An average must be truly representative of a set of data. So, when you have to find an average, it is crucial to choose the correct type of average for this particular set of data. If you use the wrong average, your results will be distorted and give misleading information.

This table, which compares the advantages and disadvantages of each type of average, will help you to make the correct decision.

<table>
<thead>
<tr>
<th></th>
<th>Mode</th>
<th>Median</th>
<th>Mean</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advantages</td>

</table>
EXAMPLE 1

The ages of 20 people attending a conference are
23, 25, 26, 28, 28, 34, 34, 34, 37, 45, 47, 48, 52, 53, 56, 63, 70, 73, 77

a Find i the mode, ii the median, iii the mean of the data.
b Which average best represents the age of the people at the conference.

a i The mode is 34, ii the median is 46, iii the mean is \( 920 \div 20 = 46 \)
b The mean is distorted because of the few very old people at the conference. The median is also distorted by the larger values, so in this case the mode would be the most representative average.

EXERCISE 11A

Shopkeepers always want to keep the most popular items in stock. Which average do you think is often known as the shopkeeper’s average?

A list contains seven even numbers. The largest number is 24. The smallest number is half the largest. The mode is 14 and the median is 16. Two of the numbers add up to 42. What are the seven numbers?

The marks of 25 students in an English examination are as follows.
55, 63, 24, 47, 60, 45, 50, 89, 39, 47, 38, 42, 69, 73, 38, 47, 53, 64, 58, 71, 41, 48, 68, 64, 75

Find the median.

Decide which average you would use for each of the following. Give a reason for your answer.

a The average mark in an examination.
b The average pocket money for a group of 16-year-old students.
c The average shoe size for all the girls in Year 10.
d The average height for all the artistes on tour with a circus.
e The average hair colour for pupils in your school.
f The average weight of all newborn babies in a hospital’s maternity ward.

A pack of matches consisted of 12 boxes. The contents of each box are as follows.
34, 31, 29, 35, 33, 30, 28, 29, 35, 32, 31

On the box it states that the average contents is 32 matches. Is this correct?
This table shows the annual salaries for a firm’s employees.

<table>
<thead>
<tr>
<th>Position</th>
<th>Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chairman</td>
<td>£43 000</td>
</tr>
<tr>
<td>Managing director</td>
<td>£37 000</td>
</tr>
<tr>
<td>Floor manager</td>
<td>£25 000</td>
</tr>
<tr>
<td>Skilled worker 1</td>
<td>£24 000</td>
</tr>
<tr>
<td>Skilled worker 2</td>
<td>£24 000</td>
</tr>
<tr>
<td>Machinist</td>
<td>£18 000</td>
</tr>
<tr>
<td>Computer engineer</td>
<td>£18 000</td>
</tr>
<tr>
<td>Secretary</td>
<td>£18 000</td>
</tr>
<tr>
<td>Office junior</td>
<td>£7 000</td>
</tr>
</tbody>
</table>

a What is i the modal salary, ii the median salary, and iii the mean salary?

b The management has suggested a pay rise for all of 6%. The shopfloor workers want a pay rise for all of £1500. What difference to the mean salary would each suggestion make?

Mr Brennan, a caring maths teacher, told each pupil their individual test mark and only gave the test statistics to the whole class. He gave the class the modal mark, the median mark and the mean mark.

a Which average would tell a pupil whether he/she were in the top half or the bottom half of the class?

b Which average tells the pupils nothing really?

c Which average allows a pupil really to gauge how well he/she has done compared with everyone else?

A list of 9 numbers has a mean of 7.6. What number must be added to the list to give a new mean of 8?

A dance group of 17 teenagers had a mean weight of 44.5 kg. To enter a competition there needs to be 18 people in the group with an average weight of 44.4 kg or less. What is the maximum weight that the eighteenth person could be?

The mean age of a group of eight walkers is 42. Joanne joins the group and the mean age changes to 40. How old is Joanne?
Using your calculator

The previous example can also be done by using the statistical mode which is available on some calculators. However, not all calculators are the same, so you will have to either read your instruction manual or experiment with the statistical keys on your calculator.

You may find one labelled 

\[ \text{DATA} \text{ or } \Sigma x \text{ or } \Sigma \text{ or } \bar{x} \] where \( x \) is printed in blue.

Try the following key strokes.

\[ 1 \times 45 \text{ DATA} \quad 2 \times 198 \text{ DATA} \quad 1 \times 121 \text{ DATA} \quad 3 \times 121 = 363 \text{ DATA} \quad 4 \times 76 = 304 \text{ DATA} \quad 5 \times 52 = 260 \text{ DATA} \quad 6 \times 13 = 78 \text{ DATA} \]

Hence, the mean number of people in a car is 1446 ÷ 505 = 2.9 (2 significant figures).

**EXAMPIE 2**

A survey was done on the number of people in each car leaving the Meadowhall Shopping Centre, in Sheffield. The results are summarised in the table.

Calculate a the mode, b the median, c the mean number of people in a car.

<table>
<thead>
<tr>
<th>Number of people in each car</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>45</td>
<td>198</td>
<td>121</td>
<td>76</td>
<td>52</td>
<td>13</td>
</tr>
</tbody>
</table>

- **a** The modal number of people in a car is easy to spot. It is the number with the largest frequency (198). Hence, the modal number of people in a car is 2.

- **b** The median number of people in a car is found by working out where the middle of the set of numbers is located. First, add up frequencies to get the total number of cars surveyed, which comes to 505. Next, calculate the middle position

\[(505 + 1) ÷ 2 = 253\]

You now need to add the frequencies across the table to find which group contains the 253rd item. The 243rd item is the end of the group with 2 in a car. Therefore, the 253rd item must be in the group with 3 in a car. Hence, the median number of people in a car is 3.

- **c** The mean number of people in a car is found by calculating the total number of people, and then dividing this total by the number of cars surveyed.

<table>
<thead>
<tr>
<th>Number in car</th>
<th>Frequency</th>
<th>Number in these cars</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>45</td>
<td>1 \times 45 = 45</td>
</tr>
<tr>
<td>2</td>
<td>198</td>
<td>2 \times 198 = 396</td>
</tr>
<tr>
<td>3</td>
<td>121</td>
<td>3 \times 121 = 363</td>
</tr>
<tr>
<td>4</td>
<td>76</td>
<td>4 \times 76 = 304</td>
</tr>
<tr>
<td>5</td>
<td>52</td>
<td>5 \times 52 = 260</td>
</tr>
<tr>
<td>6</td>
<td>13</td>
<td>6 \times 13 = 78</td>
</tr>
<tr>
<td><strong>Totals</strong></td>
<td><strong>505</strong></td>
<td><strong>1446</strong></td>
</tr>
</tbody>
</table>

Hence, the mean number of people in a car is 1446 ÷ 505 = 2.9 (2 significant figures).
Find i the mode, ii the median and iii the mean from each frequency table below.

a A survey of the shoe sizes of all the Y10 boys in a school gave these results.

<table>
<thead>
<tr>
<th>Shoe size</th>

</tr>
<tr>
<td>5</td>
<td>3</td>
</tr>
</tbody>
</table>

a Assuming each child at the school is shown in the data, how many children are at the school?

b Calculate the mean number of children in a family.

c How many families have this mean number of children?

d How many families would consider themselves average from this survey?

A dentist kept records of how many teeth he extracted from his patients.

- In 1970 he extracted 598 teeth from 271 patients.
- In 1980 he extracted 332 teeth from 196 patients.
- In 1990 he extracted 374 teeth from 288 patients.

a Calculate the average number of teeth taken from each patient in each year.

b Explain why you think the average number of teeth extracted falls each year.

The teachers in a school were asked to indicate the average number of hours they spent each day marking. The table summarises their replies.

<table>
<thead>
<tr>
<th>Number of hours spent marking</th>
<th>Number of teachers</th>
</tr>
</thead>
<tbody>
<tr>

<td>12</td>
<td>15</td>
<td>18</td>
<td>14</td>
<td>8</td>
<td>8</td>
<td>8</td>
<td>2</td>
</tr>
</tbody>
</table>

a. What is the modal score for each player?
b. What is the range of scores for each player?
c. What is the median score for each player?
d. What is the mean score for each player?
e. Which player is the more consistent and explain why?
f. Who would you say is the better player and state why?

The number of league goals scored by a football team over a season is given in the table.

<table>
<thead>
<tr>
<th>Number of goals scored</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of matches</td>
<td>3</td>
<td>8</td>
<td>10</td>
<td>11</td>
<td>4</td>
<td>2</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

a. How many games were played that season?
b. What is the range of goals scored?
c. What is the modal number of goals scored?
d. What is the median number of goals scored?
e. What is the mean number of goals scored?
f. Which average do you think the team’s supporters would say is the average number of goals scored by the team that season?
g. If the team also scored 20 goals in ten cup matches that season, what was the mean number of goals the team scored throughout the whole season?

The table shows the number of passengers in each of 100 taxis leaving London Airport one day.

<table>
<thead>
<tr>
<th>No. of passengers in a taxi</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. of taxis</td>
<td>x</td>
<td>40</td>
<td>y</td>
<td>26</td>
</tr>
</tbody>
</table>

a. Find the value of $x + y$.
b. If the mean number of passengers per taxi is 2.66, show that $x + 3y = 82$.
c. Find the values of $x$ and $y$ by solving appropriate equations.
d. State the median of the number of passengers per taxi.
Sometimes the information we are given is grouped in some way, as in the table in Example 3, which shows the range of weekly pocket money given to Y10 students in a particular class.

**EXAMPLE 3**

From the data in the table

- **a** write down the **modal group**
- **b** calculate an estimate of the mean weekly pocket money.

<table>
<thead>
<tr>
<th>Pocket money, p, (£)</th>
<th>No. of students</th>
<th>Frequency (f)</th>
<th>Midway (m)</th>
<th>f × m</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 &lt; p ≤ 1</td>
<td>2</td>
<td>0.50</td>
<td></td>
<td>1.00</td>
</tr>
<tr>
<td>1 &lt; p ≤ 2</td>
<td>5</td>
<td>1.50</td>
<td></td>
<td>7.50</td>
</tr>
<tr>
<td>2 &lt; p ≤ 3</td>
<td>5</td>
<td>2.50</td>
<td></td>
<td>12.50</td>
</tr>
<tr>
<td>3 &lt; p ≤ 4</td>
<td>9</td>
<td>3.50</td>
<td></td>
<td>31.50</td>
</tr>
<tr>
<td>4 &lt; p ≤ 5</td>
<td>15</td>
<td>4.50</td>
<td></td>
<td>67.50</td>
</tr>
<tr>
<td>Totals</td>
<td>36</td>
<td></td>
<td></td>
<td>120</td>
</tr>
</tbody>
</table>

The estimated mean will be £120 ÷ 36 = £3.33 (rounded off).
Note the notation used for the groups.

0 < \( p \) \( \leq \) 1 means any amount above 0p up to and including £1.

1 < \( p \) \( \leq \) 2 means any amount above £1 up to and including £2.

If you had written 0.01 – 1.00, 1.01 – 2.00, etc. for the groups, then the midway values would have been 0.505, 1.505, etc. Although technically correct, this makes the calculation of the mean harder and does not have a significant effect on the final answer, which is an estimate anyway.

This issue only arises because money is discrete data, which is data that consists of separate numbers, such as goals scored, marks in a test, number of children and shoe sizes. Normally grouped tables use continuous data which is data which can have an infinite number of different values, such as height, weight, time, area and capacity. It is always rounded-off information.

Whatever the type of data, remember to find the midway value by adding the two end values of the group and dividing by 2.

**EXERCISE 11C**

For each table of values, find the following.

i the modal group

ii an estimate for the mean

<table>
<thead>
<tr>
<th>( x )</th>
<th>0 &lt; ( x ) ( \leq ) 10</th>
<th>10 &lt; ( x ) ( \leq ) 20</th>
<th>20 &lt; ( x ) ( \leq ) 30</th>
<th>30 &lt; ( x ) ( \leq ) 40</th>
<th>40 &lt; ( x ) ( \leq ) 50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>4</td>
<td>6</td>
<td>11</td>
<td>17</td>
<td>9</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>( y )</th>
<th>0 &lt; ( y ) ( \leq ) 100</th>
<th>100 &lt; ( y ) ( \leq ) 200</th>
<th>200 &lt; ( y ) ( \leq ) 300</th>
<th>300 &lt; ( y ) ( \leq ) 400</th>
<th>400 &lt; ( y ) ( \leq ) 500</th>
<th>500 &lt; ( y ) ( \leq ) 600</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>95</td>
<td>56</td>
<td>32</td>
<td>21</td>
<td>9</td>
<td>3</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>( z )</th>
<th>0 &lt; ( z ) ( \leq ) 5</th>
<th>5 &lt; ( z ) ( \leq ) 10</th>
<th>10 &lt; ( z ) ( \leq ) 15</th>
<th>15 &lt; ( z ) ( \leq ) 20</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>16</td>
<td>27</td>
<td>19</td>
<td>13</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Weeks</th>
<th>1–3</th>
<th>4–6</th>
<th>7–9</th>
<th>10–12</th>
<th>13–15</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>5</td>
<td>8</td>
<td>14</td>
<td>10</td>
<td>7</td>
</tr>
</tbody>
</table>

Jason brought 100 pebbles back from the beach and weighed them all to the nearest gram. His results are summarised in this table.

<table>
<thead>
<tr>
<th>Weight, ( w ) (grams)</th>
<th>40 &lt; ( w ) ( \leq ) 60</th>
<th>60 &lt; ( w ) ( \leq ) 80</th>
<th>80 &lt; ( w ) ( \leq ) 100</th>
<th>100 &lt; ( w ) ( \leq ) 120</th>
<th>120 &lt; ( w ) ( \leq ) 140</th>
<th>140 &lt; ( w ) ( \leq ) 160</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>5</td>
<td>9</td>
<td>22</td>
<td>27</td>
<td>26</td>
<td>11</td>
</tr>
</tbody>
</table>

Find the following.

a the modal weight of the pebbles

b an estimate of the total weight of all the pebbles

c an estimate of the mean weight of the pebbles
One hundred light bulbs were tested by their manufacturer to see whether the average life span of the manufacturer’s bulbs was over 200 hours. The table summarises the results.

<table>
<thead>
<tr>
<th>Life span, h (hours)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>150 &lt; h ≤ 175</td>
<td>24</td>
</tr>
<tr>
<td>175 &lt; h ≤ 200</td>
<td>45</td>
</tr>
<tr>
<td>200 &lt; h ≤ 225</td>
<td>18</td>
</tr>
<tr>
<td>225 &lt; h ≤ 250</td>
<td>10</td>
</tr>
<tr>
<td>250 &lt; h ≤ 275</td>
<td>3</td>
</tr>
</tbody>
</table>

a What is the modal length of time a bulb lasts?

b What percentage of bulbs last longer than 200 hours?

c Estimate the mean life span of the light bulbs.

d Do you think the test shows that the average life span is over 200 hours? Fully explain your answer.

The table shows the distances run by an athlete who is training for a marathon.

<table>
<thead>
<tr>
<th>Distance, d, miles</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 &lt; d ≤ 5</td>
<td>3</td>
</tr>
<tr>
<td>5 &lt; d ≤ 10</td>
<td>8</td>
</tr>
<tr>
<td>10 &lt; d ≤ 15</td>
<td>13</td>
</tr>
<tr>
<td>15 &lt; d ≤ 20</td>
<td>5</td>
</tr>
<tr>
<td>20 &lt; d ≤ 25</td>
<td>2</td>
</tr>
</tbody>
</table>

a It is recommended that an athlete’s daily average mileage should be at least one third of the distance of the race being trained for. A marathon is 26.2 miles. Is this athlete doing enough training?

b The athlete records the times of some runs and calculates that her average pace for all runs is 6\frac{1}{2} minutes to a mile. Explain why she is wrong to expect a finishing time of 26.2 \times 6\frac{1}{2} minutes = 170 minutes for the marathon.

c The athlete claims that the difference between her shortest and longest run is 21 miles. Could this be correct? Explain your answer.

The owners of a boutique did a survey to find the average age of people using the boutique. The table summarises the results.

<table>
<thead>
<tr>
<th>Age (years)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>14–18</td>
<td>26</td>
</tr>
<tr>
<td>19–20</td>
<td>24</td>
</tr>
<tr>
<td>21–26</td>
<td>19</td>
</tr>
<tr>
<td>27–35</td>
<td>16</td>
</tr>
<tr>
<td>36–50</td>
<td>11</td>
</tr>
</tbody>
</table>

What do you think is the average age of the people using the boutique?

Three supermarkets each claimed to have the lowest average price increase over the year. The table summarises their average price increases.

<table>
<thead>
<tr>
<th>Price increase (p)</th>
<th>Soundbuy</th>
<th>Springfields</th>
<th>Setco</th>
</tr>
</thead>
<tbody>
<tr>
<td>1–5</td>
<td>4</td>
<td>5</td>
<td>3</td>
</tr>
<tr>
<td>6–10</td>
<td>10</td>
<td>11</td>
<td>8</td>
</tr>
<tr>
<td>11–15</td>
<td>14</td>
<td>12</td>
<td>15</td>
</tr>
<tr>
<td>16–20</td>
<td>23</td>
<td>19</td>
<td>31</td>
</tr>
<tr>
<td>21–25</td>
<td>19</td>
<td>25</td>
<td>21</td>
</tr>
<tr>
<td>26–30</td>
<td>8</td>
<td>9</td>
<td>7</td>
</tr>
<tr>
<td>31–35</td>
<td>2</td>
<td>6</td>
<td>3</td>
</tr>
</tbody>
</table>

Using their average price increases, make a comparison of the supermarkets and write a report on which supermarket, in your opinion, has the lowest price increases over the year. Don't forget to justify your answers.
To help people understand it, statistical information is often presented in pictorial or diagrammatic form. For example, you should have seen pie charts, bar charts and stem-and-leaf diagrams. Another method of showing data is by frequency polygons.

Frequency polygons can be used to represent both ungrouped data and grouped data, as shown in Example 4 and Example 5 respectively. They are useful to show the shapes of distributions, and can be used to compare distributions.

**EXAMPLE 4**

<table>
<thead>
<tr>
<th>No. of children</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>12</td>
<td>23</td>
<td>36</td>
<td>28</td>
<td>16</td>
<td>11</td>
</tr>
</tbody>
</table>

This is the frequency polygon for the ungrouped data in the table.

- You simply plot the coordinates from each ordered pair in the table.
- You complete the polygon by joining up the plotted points with straight lines.
You should already be familiar with the bar chart in which the vertical axis represents frequency, and the horizontal axis represents the type of data. (Sometimes it is more convenient to have the axes the other way.)

A histogram looks similar to a bar chart, but there are four fundamental differences.  
- There are no gaps between the bars.

### Example 5

<table>
<thead>
<tr>
<th>Weight, $w$ (kilograms)</th>
<th>$0 &lt; w \leq 5$</th>
<th>$5 &lt; w \leq 10$</th>
<th>$10 &lt; w \leq 15$</th>
<th>$15 &lt; w \leq 20$</th>
<th>$20 &lt; w \leq 25$</th>
<th>$25 &lt; w \leq 30$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>4</td>
<td>13</td>
<td>25</td>
<td>32</td>
<td>17</td>
<td>9</td>
</tr>
</tbody>
</table>

This is the frequency polygon for the grouped data in the table.
• The horizontal axis has a continuous scale since it represents **continuous** data, such as time, weight or length.

• The area of each bar represents the class or group frequency of the bar.

• The vertical axis is labelled “Frequency density”, where

  \[
  \text{Frequency density} = \frac{\text{Frequency of class interval}}{\text{Width of class interval}}
  \]

When the data is not continuous, a simple bar chart is used. For example, you would use a bar chart to represent the runs scored in a test match or the goals scored by a hockey team.

Look at the histogram below, which has been drawn from this table of times taken by people to walk to work.

<table>
<thead>
<tr>
<th>Time, ( t ) (min)</th>
<th>( 0 &lt; t \leq 4 )</th>
<th>( 4 &lt; t \leq 8 )</th>
<th>( 8 &lt; t \leq 12 )</th>
<th>( 12 &lt; t \leq 16 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>8</td>
<td>12</td>
<td>10</td>
<td>7</td>
</tr>
<tr>
<td>Frequency density</td>
<td>2</td>
<td>3</td>
<td>2.5</td>
<td>1.75</td>
</tr>
</tbody>
</table>

Notice that each histogram bar starts at the **least possible** time and finishes at the **greatest possible** time for its group.

**Using your calculator**

Histograms can also be drawn on graphics calculators or by using computer software packages. If you have access to either of these, try to use them.
The table shows how many students were absent from one particular class throughout the year.

<table>
<thead>
<tr>
<th>Students absent</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>48</td>
<td>32</td>
<td>12</td>
<td>3</td>
<td>1</td>
</tr>
</tbody>
</table>

a Draw a frequency polygon to illustrate the data.
b Calculate the mean number of absences each lesson.

The table shows the number of goals scored by a hockey team in one season.

<table>
<thead>
<tr>
<th>Goals</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>3</td>
<td>9</td>
<td>7</td>
<td>5</td>
<td>2</td>
</tr>
</tbody>
</table>

a Draw the frequency polygon for this data.
b Calculate the mean number of goals scored per game in the season.

The frequency polygon shows the amount of money spent in a corner shop by the first 40 customers on one day.

<table>
<thead>
<tr>
<th>Amount spent, £</th>
<th>0 &lt; m ≤ 1</th>
<th>1 &lt; m ≤ 2</th>
<th>2 &lt; m ≤ 3</th>
<th>3 &lt; m ≤ 4</th>
<th>4 &lt; m ≤ 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>3</td>
<td>5</td>
<td>18</td>
<td>10</td>
<td>4</td>
</tr>
</tbody>
</table>

a i Use the frequency polygon to complete the table for the amounts spent by the first 40 customers

ii Work out the mean amount of money spent by these 40 customers.

b Mid morning the shopkeeper records the amount spent by another 40 customers. The table below shows the data.

<table>
<thead>
<tr>
<th>Amount spent, m, £</th>
<th>0 &lt; m ≤ 2</th>
<th>2 &lt; m ≤ 4</th>
<th>4 &lt; m ≤ 6</th>
<th>6 &lt; m ≤ 8</th>
<th>8 &lt; m ≤ 10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>3</td>
<td>5</td>
<td>18</td>
<td>10</td>
<td>4</td>
</tr>
</tbody>
</table>

i On a copy of the graph above, draw the frequency polygon to show this data?

ii Calculate the mean amount spent by the 40 mid-morning customers.

c Comment on the differences between the frequency polygons and the average amounts spent by the different sets of customers.
The table shows the range of heights of the girls in Y11 at a London school.

<table>
<thead>
<tr>
<th>Height, h (cm)</th>
<th>120 &lt; h ≤ 130</th>
<th>130 &lt; h ≤ 140</th>
<th>140 &lt; h ≤ 150</th>
<th>150 &lt; h ≤ 160</th>
<th>160 &lt; h ≤ 170</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>15</td>
<td>37</td>
<td>25</td>
<td>13</td>
<td>5</td>
</tr>
</tbody>
</table>

\[ a \] Draw a frequency polygon for this data.  \[ b \] Draw a histogram for this data.  \[ c \] Estimate the mean height of the girls.

A doctor was concerned at the length of time her patients had to wait to see her when they came to the morning surgery. The survey she did gave her these results.

<table>
<thead>
<tr>
<th>Time, m (minutes)</th>
<th>0 &lt; m ≤ 10</th>
<th>10 &lt; m ≤ 20</th>
<th>20 &lt; m ≤ 30</th>
<th>30 &lt; m ≤ 40</th>
<th>40 &lt; m ≤ 50</th>
<th>50 &lt; m ≤ 60</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monday</td>
<td>5</td>
<td>8</td>
<td>17</td>
<td>9</td>
<td>7</td>
<td>4</td>
</tr>
<tr>
<td>Tuesday</td>
<td>9</td>
<td>8</td>
<td>16</td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>Wednesday</td>
<td>7</td>
<td>6</td>
<td>18</td>
<td>2</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

\[ a \] Draw a frequency polygon for each day on the same pair of axes.  \[ b \] What is the average amount of time spent waiting each day?  \[ c \] Why might the average time for each day be different?

11.5 Histograms with bars of unequal width

In this section you will learn how to:
- draw and read histograms where the bars are of unequal width
- find the median, quartiles and interquartile range from a histogram

Key words:
class interval  
interquartile range  
lower quartile  
median  
upper quartile

Sometimes the data in a frequency distribution are grouped into classes whose intervals are different. In this case, the resulting histogram has bars of unequal width.

The key fact that you should always remember is that the area of a bar in a histogram represents the class frequency of the bar. So, in the case of an unequal-width histogram, the height to draw each bar is found by dividing its class frequency by its class interval width (bar width), which is the difference between the lower and upper bounds for each interval. Conversely, given a histogram, any of its class frequencies can be found by multiplying the height of the corresponding bar by its width.

It is for this reason that the scale on the vertical axes of histograms is nearly always labelled “Frequency density”, where

\[
\text{Frequency density} = \frac{\text{Frequency of class interval}}{\text{Width of class interval}}
\]
EXAMPLE 6

The heights of a group of girls were measured. The results were classified as shown in the table.

<table>
<thead>
<tr>
<th>Height, h (cm)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>151 ≤ h &lt; 155</td>
<td>64</td>
</tr>
<tr>
<td>153 ≤ h &lt; 154</td>
<td>43</td>
</tr>
<tr>
<td>154 ≤ h &lt; 155</td>
<td>47</td>
</tr>
<tr>
<td>155 ≤ h &lt; 159</td>
<td>96</td>
</tr>
<tr>
<td>159 ≤ h &lt; 160</td>
<td>12</td>
</tr>
</tbody>
</table>

It is convenient to write the table vertically and add two columns, class width and frequency density.

The class width is found by subtracting the lower class boundary from the upper class boundary. The frequency density is found by dividing the frequency by the class width.

<table>
<thead>
<tr>
<th>Height, h (cm)</th>
<th>Frequency</th>
<th>Class width</th>
<th>Frequency density</th>
</tr>
</thead>
<tbody>
<tr>
<td>151 ≤ h &lt; 155</td>
<td>64</td>
<td>2</td>
<td>32</td>
</tr>
<tr>
<td>153 ≤ h &lt; 154</td>
<td>43</td>
<td>1</td>
<td>43</td>
</tr>
<tr>
<td>154 ≤ h &lt; 155</td>
<td>47</td>
<td>1</td>
<td>47</td>
</tr>
<tr>
<td>155 ≤ h &lt; 159</td>
<td>96</td>
<td>4</td>
<td>24</td>
</tr>
<tr>
<td>159 ≤ h &lt; 160</td>
<td>12</td>
<td>1</td>
<td>12</td>
</tr>
</tbody>
</table>

The histogram can now be drawn. The horizontal scale should be marked off as normal from a value below the lowest value in the table to a value above the largest value in the table. In this case, mark the scale from 150 cm to 160 cm. The vertical scale is always frequency density and is marked up to at least the largest frequency density in the table. In this case, 50 is a sensible value.

Each bar is drawn between the lower class interval and the upper class interval horizontally, and up to the frequency density vertically.
EXAMPLE 7

This histogram shows the distribution of heights of daffodils in a greenhouse.

a Complete a frequency table for the heights of the daffodils, and show the cumulative frequency.
b Find the median height.
c Find the interquartile range of the heights.
d Estimate the mean of the distribution.

\[
\begin{array}{|c|c|c|c|c|c|}
\hline
\text{Height, } h \text{ (cm)} & 24 \leq h < 26 & 26 \leq h < 27 & 27 \leq h < 28 & 28 \leq h < 31 & 31 \leq h < 37 \\
\hline
\text{Frequency} & 50 & 50 & 60 & 120 & 120 \\
\hline
\text{Cumulative frequency} & 50 & 100 & 160 & 280 & 400 \\
\hline
\end{array}
\]

b There are 400 values so the median will be the 200th value. Counting up the frequencies from the beginning we get the third row of the table above.

The median occurs in the 25 \leq h < 31 group. There are 160 values before this group and 120 in it. To get to the 200th value we need to go 40 more values into this group. 40 out of 120 is one-third. One third of the way through this group is the value 29 cm. Hence the median is 29 cm.

c The interquartile range is the difference between the upper quartile and the lower quartile, the quarter and three-quarter values respectively. In this case, the lower quartile is the 100th value (found by dividing 400, the total number of values, by 4) and the upper quartile is the 300th value. So, in the same way that you found the median, you can find the lower (100th value) and upper (300th value) quartiles. The 100th value is at 27 cm and the 300th value is at 32 cm. The interquartile range is 32 cm – 27 cm = 5 cm.

d To estimate the mean, use the table to get the midway values of the groups and multiply these by the frequencies. The sum of these divided by 400 will give the estimated mean.

So, the mean is

\[
\begin{align*}
(25 \times 50 + 26.5 \times 50 + 27.5 \times 60 + 29.5 \times 120 + 34 \times 120) & - 400 \\
& = 11 845 - 400 = 29.6 \text{ cm (3 significant figures)}
\end{align*}
\]
Draw histograms for these grouped frequency distributions.

<table>
<thead>
<tr>
<th>Temperature, $t$ (°C)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>$8 \leq t &lt; 10$</td>
<td>5</td>
</tr>
<tr>
<td>$10 \leq t &lt; 12$</td>
<td>13</td>
</tr>
<tr>
<td>$12 \leq t &lt; 15$</td>
<td>18</td>
</tr>
<tr>
<td>$15 \leq t &lt; 17$</td>
<td>4</td>
</tr>
<tr>
<td>$17 \leq t &lt; 20$</td>
<td>3</td>
</tr>
<tr>
<td>$20 \leq t &lt; 24$</td>

<tr>
<td>$12 \leq t &lt; 16$</td>
<td>54</td>
</tr>
<tr>
<td>$16 \leq t &lt; 20$</td>
<td>36</td>
</tr>
</tbody>
</table>

The following information was gathered about the weekly pocket money given to 14 year olds.

<table>
<thead>
<tr>
<th>Pocket money, $p$ (£)</th>
<th>Girls</th>
<th>Boys</th>
</tr>
</thead>
<tbody>
<tr>
<td>$0 \leq p &lt; 2$</td>
<td>8</td>
<td>6</td>
</tr>
<tr>
<td>$2 \leq p &lt; 4$</td>
<td>15</td>
<td>11</td>
</tr>
<tr>
<td>$4 \leq p &lt; 5$</td>
<td>22</td>
<td>25</td>
</tr>
<tr>
<td>$5 \leq p &lt; 8$</td>
<td>12</td>
<td>15</td>
</tr>
<tr>
<td>$8 \leq p &lt; 10$</td>
<td>4</td>
<td>6</td>
</tr>
</tbody>
</table>

- Represent the information about the boys on a histogram.
- Represent both sets of data with a frequency polygon, using the same pair of axes.
- What is the mean amount of pocket money given to each sex? Comment on your answer.

The sales of the Star newspaper over 65 years are recorded in this table.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Copies</td>
<td>62 000</td>
<td>68 000</td>
<td>71 000</td>
<td>75 000</td>
<td>63 000</td>
<td>52 000</td>
</tr>
</tbody>
</table>

The London trains were always late, so one month a survey was undertaken to find how many trains were late, and by how many minutes (to the nearest minute). The results are illustrated by this histogram.

How many trains were in the survey?

How many trains were delayed for longer than 15 minutes?

For each of the frequency distributions illustrated in the histograms

(i) write down the grouped frequency table,
(ii) state the modal group,
(iii) estimate the median,
(iv) find the lower and upper quartiles and the interquartile range,
(v) estimate the mean of the distribution.
All the patients in a hospital were asked how long it was since they last saw a doctor. The results are shown in the table.

<table>
<thead>
<tr>
<th>Hours, $h$</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>$0 \leq h &lt; 2$</td>
<td>8</td>
</tr>
<tr>
<td>$2 \leq h &lt; 4$</td>
<td>12</td>
</tr>
<tr>
<td>$4 \leq h &lt; 6$</td>
<td>20</td>
</tr>
<tr>
<td>$6 \leq h &lt; 10$</td>
<td>30</td>
</tr>
<tr>
<td>$10 \leq h &lt; 16$</td>
<td>20</td>
</tr>
<tr>
<td>$16 \leq h &lt; 24$</td>
<td>10</td>
</tr>
</tbody>
</table>

a Find the median time since a patient last saw a doctor.

b Estimate the mean time since a patient last saw a doctor.

c Find the interquartile range of the times.

One summer, Albert monitored the weight of the tomatoes grown on each of his plants. His results are summarised in this table.

<table>
<thead>
<tr>
<th>Weight, $w$ (kg)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>$6 \leq w &lt; 10$</td>
<td>8</td>
</tr>
<tr>
<td>$10 \leq w &lt; 12$</td>
<td>15</td>
</tr>
<tr>
<td>$12 \leq w &lt; 16$</td>
<td>28</td>
</tr>
<tr>
<td>$16 \leq w &lt; 20$</td>
<td>16</td>
</tr>
<tr>
<td>$20 \leq w &lt; 25$</td>
<td>10</td>
</tr>
</tbody>
</table>

a Draw a histogram for this distribution.

b Estimate the median weight of tomatoes the plants produced.

c Estimate the mean weight of tomatoes the plants produced.

d How many plants produced more than 15 kg?
A survey was carried out to find the speeds of cars passing a particular point on the M1. The histogram illustrates the results of the survey.

![Histogram of car speeds](image)

a Copy and complete this table.

<table>
<thead>
<tr>
<th>Speed, ( v ) (mph)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>( 0 &lt; v \leq 40 )</td>
<td>10</td>
</tr>
<tr>
<td>( 40 &lt; v \leq 50 )</td>
<td>40</td>
</tr>
<tr>
<td>( 50 &lt; v \leq 60 )</td>
<td>110</td>
</tr>
<tr>
<td>( 60 &lt; v \leq 70 )</td>
<td></td>
</tr>
<tr>
<td>( 70 &lt; v \leq 80 )</td>
<td></td>
</tr>
<tr>
<td>( 80 &lt; v \leq 100 )</td>
<td></td>
</tr>
</tbody>
</table>

b Find the number of cars included in the survey.

c Work out an estimate of the median speed of the cars on this part of the M1.

d Work out an estimate of the mean speed of the cars on this part of the M1.

### 11.6 Moving averages

In this section you will learn how to:
- calculate a moving average and use it to predict future trends

Key words
- moving average
- seasonal trend
- trend line

A moving average gives a clear indication of the trend of a set of data. It smoothes out, for example, seasonal trends such as monthly variations or daily differences.
In Example 8, we used an interval of four months to construct a moving average but there is nothing special about this interval. It could well have been five or six months, except that you would then have needed data for more months to give sufficient mean values to show a trend. The number of months, weeks or even years used for moving averages depends on the likely variations of the data. You would not expect to use less than three or more than 12 items of data at a time.
The table shows the daily sales of milk at a local corner shop for a month.

<table>
<thead>
<tr>
<th>Sun</th>
<th>Mon</th>
<th>Tue</th>
<th>Wed</th>
<th>Thu</th>
<th>Fri</th>
<th>Sat</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>8</td>
<td>6</td>
<td>9</td>
<td>4</td>
<td>11</td>
<td>15</td>
</tr>
<tr>
<td>11</td>
<td>7</td>
<td>7</td>
<td>6</td>
<td>3</td>
<td>15</td>
<td>14</td>
</tr>
<tr>
<td>14</td>
<td>9</td>
<td>7</td>
<td>7</td>
<td>5</td>
<td>12</td>
<td>15</td>
</tr>
<tr>
<td>11</td>
<td>12</td>
<td>8</td>
<td>7</td>
<td>4</td>
<td>14</td>
<td>19</td>
</tr>
</tbody>
</table>

Make a table showing the moving average using a seven-day span, and draw a graph to show the trend of milk sales over the month.

The table shows the amounts collected for a charity by the students at Pope Pius School in the ten weeks leading up to Christmas.

<table>
<thead>
<tr>
<th>Week</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
<th>10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount (£)</td>
<td>42</td>
<td>45</td>
<td>44</td>
<td>47</td>
<td>33</td>
<td>40</td>
<td>45</td>
<td>51</td>
<td>42</td>
<td>45</td>
</tr>
</tbody>
</table>

a Plot a line graph of the amounts collected and a four-week moving average.
b Comment on the trend shown.

c The table shows the quarterly electricity bill over a four-year period.

<table>
<thead>
<tr>
<th>Year</th>
<th>2002</th>
<th>2003</th>
<th>2004</th>
<th>2005</th>
</tr>
</thead>
<tbody>
<tr>
<td>First quarter</td>
<td>£123.39</td>
<td>£119.95</td>
<td>£127.39</td>
<td>£132.59</td>
</tr>
<tr>
<td>Second quarter</td>
<td>£108.56</td>
<td>£113.16</td>
<td>£117.76</td>
<td>£119.76</td>
</tr>
<tr>
<td>Third quarter</td>
<td>£87.98</td>
<td>£77.98</td>
<td>£102.58</td>
<td>£114.08</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>£112.47</td>
<td>£127.07</td>
<td>£126.27</td>
<td>£130.87</td>
</tr>
</tbody>
</table>

a Plot the line graph of the electricity bills shown in the table, and on the same axes plot a four-quarter moving average.
b Comment on the price of electricity over the four years.
c Use the trend line of the moving averages to predict the bill for the first quarter of 2006.

d The table shows the telephone bills for a family over four years.

<table>
<thead>
<tr>
<th>Year</th>
<th>2002</th>
<th>2003</th>
<th>2004</th>
<th>2005</th>
</tr>
</thead>
<tbody>
<tr>
<td>First quarter</td>
<td>£82</td>
<td>£87</td>
<td>£98</td>
<td>£88</td>
</tr>
<tr>

<tr>
<td>Third quarter</td>
<td>£67</td>
<td>£72</td>
<td>£87</td>
<td>£78</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>£84</td>
<td>£81</td>
<td>£97</td>
<td>£87</td>
</tr>
</tbody>
</table>

a Plot a line graph showing the amounts paid each month.
b Plot a four-quarter moving average.
c Comment on the trend shown and give a possible reason for it.
d Use the trend line of the moving averages to predict the bill for the first quarter of 2006.
A factory making computer components has the following sales figures (in hundreds) for electric fans.

<table>
<thead>
<tr>
<th></th>
<th>Jan</th>
<th>Feb</th>
<th>Mar</th>
<th>Apr</th>
<th>May</th>
<th>Jun</th>
<th>Jul</th>
<th>Aug</th>
<th>Sep</th>
<th>Oct</th>
<th>Nov</th>
<th>Dec</th>
</tr>
</thead>
<tbody>
<tr>
<td>2004</td>
<td>12</td>
<td>13</td>
<td>12</td>
<td>14</td>
<td>13</td>
<td>3</td>
<td>15</td>
<td>12</td>
<td>14</td>

a. Plot a line graph showing the sales for each product over these years.

b. On the same diagram, plot the three-year moving average of each product.

c. Comment on the trends seen in the sales of video recorders and DVDs.

d. Use the trend line of the moving averages to predict the number of video recorders and DVD players sold in 2006.

11.7 Surveys

In this section you will learn how to:
- conduct surveys
- ask good questions in order to collect reliable and valid data

Key words: data collection, hypothesis, leading question, survey

A survey is an organised way of asking a lot of people a few, well-constructed questions, or of making a lot of observations in an experiment, in order to reach a conclusion about something.

Surveys are used to test out people’s opinions or to test a hypothesis.
Simple data collection sheet

If you just need to collect some data to analyse, you will have to design a simple data collection sheet. This section will show you how to design a clear, easy-to-fill-in data collection sheet.

For example, if you want to find out Y10 students’ preferences for the end-of-term trip from four options you could ask:

*Where do you want to go for the Y10 trip at the end of term – Blackpool, Alton Towers, The Great Western Show or London?*

You would put this question, on the same day, to a lot of Y10 students, and enter their answers straight onto a data collection sheet, as below.

<table>
<thead>
<tr>
<th>Place</th>
<th>Tally</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blackpool</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Alton Towers</td>
<td></td>
<td></td>
</tr>
<tr>
<td>The Great Western Show</td>
<td></td>
<td></td>
</tr>
<tr>
<td>London</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Notice how plenty of space is available for the tally marks, and how the tallies are gated in groups of five to make counting easier when the survey is complete.

This is a good, simple data collection sheet because:

- only one question (*Where do you want to go?*) has to be asked
- all the four possible venues are listed
- the answer from each interviewee can be easily and quickly tallied, then on to the next interviewee.

Notice, too, that since the question listed specific places, they must appear on the data collection sheet. You would lose many marks in an examination if you just asked the open question: *Where do you want to go?*

Data sometimes needs to be collected to obtain responses for two different categories. The data collection sheet is then in the form of a two-way table.
Using your computer

Once the data has been collected for your survey, it can be put into a computer database. This allows the data to be stored and amended or updated at a later date if necessary.

From the database, suitable statistical diagrams can easily be drawn using software, and averages calculated. The results can then be published in, for example, the school magazine.

**EXERCISE 11G**

1. “People like the supermarket to open on Sundays.”
   - a. To see whether this statement is true, design a data collection sheet which will allow you to capture data while standing outside a supermarket.
   - b. Does it matter on which day you collect data outside the supermarket?

2. The school tuck shop wants to know which types of chocolate it should get in to sell – plain, milk, fruit and nut, wholenut or white chocolate.
   - a. Design a data collection sheet which you could use to ask pupils in your school which of these chocolate types are their favourite.
   - b. Invent the first 30 entries on the chart.
When you throw two dice together, what number are you most likely to get?

- Design a data collection sheet on which you can record the data from an experiment in which two dice are thrown together and note the sum of the two numbers shown on the dice.
- Carry out this experiment for at least 100 throws.
- Which sums are most likely to occur?
- Illustrate your results on a frequency polygon.

Who uses the buses the most in the mornings? Is it pensioners, mums, schoolchildren, the unemployed or some other group? Design a data collection sheet to be used in a survey of bus passengers.

Design two-way tables to show

- how students in different year groups travel to school in the morning
- the type of programme which different age groups prefer to watch on TV
- the favourite sport of boys and girls
- how much time students in different year groups spend on the computer in the evening.

Invent about 40 entries for each one.

Questionnaires

This section will show you how to put together a clear, easy-to-use questionnaire.

When you are putting together a questionnaire, you must think very carefully about the sorts of question you are going to ask. Here are five rules that you should always follow.

- Never ask a leading question designed to get a particular response.
- Never ask a personal, irrelevant question.
- Keep each question as simple as possible.
- Include questions that will get a response from whomever is asked.
- Make sure the responses do not overlap and keep the number of choices to a reasonable number (six at the most).
The following questions are badly constructed and should never appear in any questionnaire.

*What is your age?* This is personal. Many people will not want to answer. It is always better to give a range of ages.

- □ Under 15
- □ 16–20
- □ 21–30
- □ 31–40
- □ Over 40

*Slaughtering animals for food is cruel to the poor defenceless animals. Don’t you agree?* This is a leading question, designed to get a “yes” response. It is better to ask an impersonal question.

*Are you a vegetarian?* □ Yes □ No

*Do you go to discos when abroad?* This can be answered only by people who have been abroad. It is better to ask a starter question, with a follow-up question.

- Have you been abroad for a holiday? □ Yes □ No
- If yes, did you go to a disco whilst you were away? □ Yes □ No

*When you first get up in a morning and decide to have some sort of breakfast that might be made by somebody else, do you feel obliged to eat it all or not?* This is a too-complicated question. It is better to ask a series of shorter questions.

- What time do you get up for school? □ Before 7 □ Between 7 and 8 □ After 8
- Do you have breakfast every day? □ Yes □ No
- If No, on how many school days do you have breakfast? □ 0 □ 1 □ 2 □ 3 □ 4 □ 5

A questionnaire is usually put together to test a hypothesis or a statement. For example, a questionnaire might be constructed to test this statement.

*People buy cheaper milk from the supermarket as they don’t mind not getting it on their doorstep. They’d rather go out to buy it.*

A questionnaire designed to test whether this statement is true or not should include these questions:

- Do you have milk delivered to your doorstep?
- Do you buy cheaper milk from the supermarket?
- Would you buy your milk only from the supermarket?

Once these questions have been answered, the responses can be looked at to see whether the majority of people hold views that agree with the statement.
These are questions from a questionnaire on healthy eating.

a. Fast food is bad for you. Don’t you agree?
   □ Strongly agree □ Agree □ Don’t know

Give two criticisms of the question.

b. Do you eat fast food? □ Yes □ No
   If yes, how many times on average do you eat fast food a week?
   □ Once or less □ 2 or 3 times □ 4 or 5 times □ More than 5 times

Give two reasons why these are good questions.

This is a question from a survey on pocket money.

How much pocket money do you get each week?
   □ £0–£2 □ £0–£5 □ £5–£10 □ £10 or more

a. Give a reason why this is not a good question.

b. Rewrite the question to make it good question.

Design a questionnaire to test this statement.
   People under 16 do not know what is meant by all the jargon used in the business news on TV, but the over-twenties do.

Design a questionnaire to test this statement.
   The under-twenties feel quite at ease with computers, while the over-forties would rather not bother with them. The 20–40s are all able to use computers effectively.

Design a questionnaire to test this hypothesis.
   The older you get, the less sleep you need.

A head teacher wants to find out if her pupils think they have too much, too little or just the right amount of homework. She also wants to know the parents’ views about homework.

Design a questionnaire that could be used to find the data that the head teacher needs to look at.
Many situations occur in daily life where statistical techniques are used to produce data. The results of surveys appear in newspapers every day. There are many on-line polls and phone-ins to vote in reality TV shows, for example.

Results for these polls are usually given as a percentage with a margin of error, which is a measure of how accurate the information is.

Here are some common social statistics in daily use.

**General Index of Retail Prices**

This is also know as the Retail Price Index (RPI). It measures how much the daily cost of living increases (or decreases). One year is chosen as the base year and given an index number, usually 100. The costs of subsequent years are compared to this and given a number proportional to the base year, say 103, etc.

Note the numbers do not represent actual values but just compare current prices to the base year.

**Time series**

Like the RPI, a time series measures changes in a quantity over time. Unlike the RPI the actual values of the quantity are used. This might measure how the exchange rate between the pound and the dollar changes over time.

**National Census**

A national census is a survey of all people and households in a country. Data about age, gender, religion, employment status, etc. is collected to enable governments to plan where to allocate resources in the future. In Britain, a national census is taken every 10 years. The last census was in 2001.
In 2000, the cost of a litre of petrol was 68p. Using 2000 as a base year, the price index of petrol for
the next 5 years is shown in this table.

<table>
<thead>
<tr>
<th>Year</th>
<th>Index</th>
<th>Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>100</td>
<td>78p</td>
</tr>
<tr>
<td>2001</td>
<td>103</td>
<td></td>
</tr>
<tr>
<td>2002</td>
<td>108</td>
<td></td>
</tr>
<tr>
<td>2003</td>
<td>109</td>
<td></td>
</tr>
<tr>
<td>2004</td>
<td>112</td>
<td></td>
</tr>
<tr>
<td>2005</td>
<td>120</td>
<td></td>
</tr>
</tbody>
</table>

Work out the price of petrol in each subsequent year. Give your answers to 1 decimal place.

The graph shows the exchange rate for the dollar against the pound for each month in 2005.

- a What was the exchange rate in January?
- b Between which two months did the exchange rate fall the most?
- c Explain why you could not use the graph to predict the exchange rate in January 2006.

The following is taken from the UK government statistics website.

In mid-2004 the UK was home to 59.8 million people, of which 50.1 million lived in England. The average age was 38.6 years, an increase on 1971 when it was 34.1 years. In mid-2004 approximately one in five people in the UK were aged under 16 and one in six people were aged 65 or over.

Use this extract to answer these questions.

- a How many of the population of the UK do not live in England?
- b By how much has the average age increased since 1971?
- c Approximately how many of the population are under 16?
- d Approximately how many of the population are over 65?

The General Index of Retail Prices started in January 1987 when it was given a base number of 100.

In January 2006 the index number was 194.1.

If the “standard weekly shopping basket” cost £38.50 in January 1987, how much would it be in
January 2006?
This time series shows car production in Britain from November 2004 to November 2005.

a Why was there a sharp drop in production in July?

b The average production over the first three months shown was 172 thousand cars.
i Work out an approximate number for the average production over the last three months shown.

ii The base month for the index is January 2000 when the index was 100. What was the approximate production in January 2000?

11.9 Sampling

In this section you will learn how to:

- understand different methods of sampling
- collect unbiased reliable data

Key words

population random sample stratified unbiased

Statisticians often have to carry out surveys to collect information and test hypotheses about the population of a wide variety of things. (In statistics, population does not only mean a group of people, it also means a group of objects or events.)

It is seldom possible to survey a whole population, mainly because such a survey would cost too much and take a long time. Also there are populations for which it would be physically impossible to survey every member. For example, if you wanted to find the average length of eels in the North Sea, it would be impossible to find and measure every eel. So a statistician chooses a small part of the population to survey and assumes that the results for this sample are representative of the whole population.

Therefore, to ensure the accuracy of a survey, two questions have to be considered.

- Will the sample be representative of the whole population and thereby eliminate bias?
- How large should the sample be to give results which are valid for the whole population?

You will use many of these ideas in your Handling Data coursework.

Sampling methods

There are two main types of sample: random and stratified.
In a random sample, every member of the population has an equal chance of being chosen. For example, it may be the first 100 people met in a survey, or 100 names picked from a hat, or 100 names taken at random from the electoral register or a telephone directory.

In a stratified sample, the population is first divided into categories and the number of members in each category determined. The sample is then made up of members from these categories in the same proportions as they are in the population. The required sample in each category is chosen by random sampling.

**EXAMPLE 10**

A school’s pupil numbers are given in the table. The head teacher wants to take a stratified sample of 100 pupils for a survey.

a Calculate the number of boys and girls in each year that should be interviewed.

b Explain how the pupils could then be chosen to give a random sample.

<table>
<thead>
<tr>
<th>School year</th>
<th>Boys</th>
<th>Girls</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>52</td>
<td>65</td>
<td>120</td>
</tr>
<tr>
<td>8</td>
<td>46</td>
<td>51</td>
<td>97</td>
</tr>
<tr>
<td>9</td>
<td>62</td>
<td>59</td>
<td>121</td>
</tr>
<tr>
<td>10</td>
<td>47</td>
<td>61</td>
<td>108</td>
</tr>
<tr>
<td>11</td>
<td>59</td>
<td>56</td>
<td>94</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>540</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To get the correct number in each category, say, boys in year 7, the calculation is done as follows.

\[
\frac{52}{540} \times 100 = 9.6 \quad \text{(1 decimal place)}
\]

After all calculations are done, you should get the values in this table.

<table>
<thead>
<tr>
<th>School Year</th>
<th>Boys</th>
<th>Girls</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>9.6</td>
<td>12.6</td>
</tr>
<tr>
<td>8</td>
<td>8.5</td>
<td>9.4</td>
</tr>
<tr>
<td>9</td>
<td>11.5</td>
<td>10.9</td>
</tr>
<tr>
<td>10</td>
<td>8.7</td>
<td>11.3</td>
</tr>
<tr>
<td>11</td>
<td>7.2</td>
<td>10.2</td>
</tr>
</tbody>
</table>

Obviously you cannot have a decimal point of a pupil, so round off all values and make sure that the total is 100. This gives the final table.

<table>
<thead>
<tr>
<th>School year</th>
<th>Boys</th>
<th>Girls</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>10</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
<td>9</td>
<td>17</td>
</tr>
<tr>
<td>9</td>
<td>12</td>
<td>11</td>
<td>23</td>
</tr>
<tr>
<td>10</td>
<td>9</td>
<td>11</td>
<td>20</td>
</tr>
<tr>
<td>11</td>
<td>7</td>
<td>10</td>
<td>17</td>
</tr>
</tbody>
</table>

Within each category, choose pupils to survey at random. For example, all the year 7 girls could have their names put into a hat and 13 names drawn out or they could be listed alphabetically and a random number generator used to pick out 13 names from 68.
Sample size

Before the sampling of a population can begin, it is necessary to determine how much data needs to be collected to ensure that the sample is representative of the population. This is called the sample size.

Two factors determine sample size:

- the desired precision with which the sample represents the population
- the amount of money available to meet the cost of collecting the sample data.

The greater the precision desired, the larger the sample size needs to be. But the larger the sample size, the higher the cost will be. Therefore, the benefit of achieving high accuracy in a sample will always have to be set against the cost of achieving it.

There are statistical procedures for determining the most suitable sample size, but these are beyond the scope of the GCSE syllabus.

The next example addresses some of the problems associated with obtaining an unbiased sample.

### Example 11

You are going to conduct a survey among an audience of 30 000 people at a rock concert. How would you choose the sample?

1. You would not want to question all of them, so you might settle for a sample size of 2%, which is 600 people.
2. Assuming that there will be as many men at the concert as women, you would need the sample to contain the same proportion of each, namely, 300 men and 300 women.
3. Assuming that about 20% of the audience will be aged under 20, you would also need the sample to contain 120 people aged under 20 (20% of 600) and 480 people aged 20 and over (600 – 120 or 80% of 600).
4. You would also need to select people from different parts of the auditorium in equal proportions so as to get a balanced view. Say this breaks down into three equal groups of people, taken respectively from the front, the back and the middle of the auditorium. So, you would further need the sample to consist of 200 people at the front, 200 at the back and 200 in the middle.
5. If you now assume that one researcher can survey 40 concert-goers, you would arrive at this sampling strategy:
   - 600 ÷ 40 = 15 researchers to conduct the survey
   - 15 ÷ 3 = 5 researchers in each part of the auditorium

Each researcher would need to question four men aged under 20, 16 men aged 20 and over, four women aged under 20 and 16 women aged 20 and over.
Comment on the reliability of the following ways of finding a sample.

a Find out about smoking by asking 50 people in a non-smoking part of a restaurant.
b Find out how many homes have DVD players by asking 100 people outside a DVD hire shop.
c Find the most popular make of car by counting 100 cars in a city car park.
d Find a year representative on a school’s council by picking a name out of a hat.
e Decide whether the potatoes have cooked properly by testing one with a fork.

Comment on the way the following samples have been taken. For those that are not satisfactory, suggest a better way to find a more reliable sample.

a Joseph had a discussion with his dad about pocket money. To get some information, he asked 15 of his friends how much pocket money they each received.
b Douglas wanted to find out what proportion of his school went abroad for holidays, so he asked the first 20 people he came across in the school yard.
c A teacher wanted to know which lesson his pupils enjoyed most. So he asked them all.
d It has been suggested that more females go to church than males. So Ruth did a survey in her church that Sunday and counted the number of females there.
e A group of local people asked for a crossing on a busy road. The council conducted a survey by asking a randomly selected 100 people in the neighbourhood.

For a school project you have been asked to do a presentation of the social activities of the pupils in your school. You decide to interview a sample of pupils. Explain how you will choose the pupils you wish to interview if you want your results to be

a reliable,  b unbiased,  c representative,  d random.

A fast-food pizza chain attempted to estimate the number of people who eat pizzas in a certain town. One evening they telephoned 50 people living in the town and asked: “Have you eaten a pizza in the last month?” Eleven people said “Yes”. The pizza chain stated that 22% of the town’s population eat pizzas. Give three criticisms of this method of estimation.

Adam is writing a questionnaire for a survey about the Meadowhall shopping centre in Sheffield. He is told that fewer local people visit Meadowhall than people from further away. He is also told that the local people spend less money per visit. Write two questions which would help him to test these ideas. Each question should include at least three options for a response. People are asked to choose one of these options.

For another survey, Adam investigates how much is spent at the chocolate machines by students at his school. The number of students in each year group is shown in the table. Explain, with calculations, how Adam should obtain a stratified random sample of 100 students for his survey.

<table>
<thead>
<tr>
<th>Year group</th>
<th>7</th>
<th>8</th>
<th>9</th>
<th>10</th>
<th>11</th>
</tr>
</thead>
<tbody>
<tr>
<td>Numbers of students</td>
<td>143</td>
<td>132</td>
<td>156</td>
<td>131</td>
<td>108</td>
</tr>
</tbody>
</table>
Claire made a survey of pupils in her school. She wanted to find out their opinions on the eating facilities in the school. The size of each year group in the school is shown in the table.

<table>
<thead>
<tr>
<th>Year group</th>
<th>Boys</th>
<th>Girls</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>96</td>
<td>78</td>
<td>174</td>
</tr>
<tr>
<td>9</td>
<td>84</td>
<td>86</td>
<td>170</td>
</tr>
<tr>
<td>10</td>
<td>84</td>
<td>91</td>
<td>175</td>
</tr>
<tr>
<td>11</td>
<td>82</td>
<td>85</td>
<td>167</td>
</tr>
<tr>
<td>6th form</td>
<td>83</td>
<td>117</td>
<td>200</td>
</tr>
</tbody>
</table>

Claire took a sample of 90 pupils.

a Explain why she should not have sampled equal numbers of boys and girls in the sixth form.

b Calculate the number of pupils she should have sampled in the sixth form.

Using the Internet

Through the Internet you have access to a vast amount of data on many topics, which you can use to carry out statistical investigations. This data will enable you to draw statistical diagrams, answer a variety of questions and test all manner of hypotheses.

Here are some examples of hypotheses you can test.

- Football teams are most likely to win when they are playing at home.
- Boys do better than girls at GCSE mathematics.
- The number 3 gets drawn more often than the number 49 in the National Lottery.
- The literacy rate in a country is linked to that country’s average income.
- People in the north of England have larger families than people who live in the south.

The following websites are a useful source of data for some of the above.

- www.statistics.gov.uk
- www.lufc.co.uk
- www.national-lottery.co.uk
- www.cia.gov/cia/publications/factbook/
The number of matches in 20 matchboxes is shown in the table.

<table>
<thead>
<tr>
<th>No. of matches (m)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>42</td>
<td>2</td>
</tr>
<tr>
<td>43</td>
<td>5</td>
</tr>
<tr>
<td>44</td>
<td>11</td>
</tr>
<tr>
<td>45</td>
<td>1</td>
</tr>
<tr>
<td>46</td>
<td>1</td>
</tr>
</tbody>
</table>

Calculate the mean number of matches in the 20 boxes.

50 people were asked how long they had to wait for a tram. The table shows the results.

a Which class interval contains the median time?

<table>
<thead>
<tr>
<th>Time taken, $t$ (min)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>$0 &lt; t \leq 5$</td>
<td>17</td>
</tr>
<tr>
<td>$5 &lt; t \leq 10$</td>
<td>22</td>
</tr>
<tr>
<td>$10 &lt; t \leq 15$</td>
<td>9</td>
</tr>
<tr>
<td>$15 &lt; t \leq 20$</td>
<td>2</td>
</tr>
</tbody>
</table>

b Draw a frequency diagram to represent the data.

In a Junior School there are 30 students who take the Maths and Science KS2 tests. Their National Curriculum levels in these subjects are shown in the two-way table.

<table>
<thead>
<tr>
<th>Level in Maths</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 2 3 4 5 6</td>
</tr>
<tr>
<td>0 3 1 0 0 0</td>
</tr>
<tr>
<td>2 0 1 2 1 0</td>
</tr>
<tr>
<td>3 0 0 3 3 1</td>
</tr>
<tr>
<td>4 0 0 1 4 1</td>
</tr>
<tr>
<td>5 0 0 1 5 1</td>
</tr>
<tr>
<td>6 0 0 0 0 0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Level in Science</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 2 3 4 5 6</td>
</tr>
<tr>
<td>0 3 1 0 0 0</td>
</tr>
<tr>
<td>2 0 1 2 1 0</td>
</tr>
<tr>
<td>3 0 0 3 3 1</td>
</tr>
<tr>
<td>4 0 0 1 4 1</td>
</tr>
<tr>
<td>5 0 0 1 5 1</td>
</tr>
<tr>
<td>6 0 0 0 0 0</td>
</tr>
</tbody>
</table>

a What is the modal level for Maths?
b What is the median level for Maths?
Show clearly how you obtained your answer.
c What is the mean level for Science?
Show clearly how you obtained your answer.
d The teacher claims that the students are better at Maths than at Science. How can you tell from the table that this is true?

The table shows the times taken for a train journey for 20 days.

<table>
<thead>
<tr>
<th>Time taken, $t$ (min)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>$18 &lt; t \leq 20$</td>
<td>4</td>
</tr>
<tr>
<td>$20 &lt; t \leq 22$</td>
<td>6</td>
</tr>
<tr>
<td>$22 &lt; t \leq 24$</td>
<td>5</td>
</tr>
<tr>
<td>$24 &lt; t \leq 26$</td>
<td>3</td>
</tr>
<tr>
<td>$26 &lt; t \leq 28$</td>
<td>2</td>
</tr>
</tbody>
</table>

Calculate an estimate of the mean journey time.

Some students at Highfliers School took a mathematics examination. The unfinished table and histogram show some information about their marks.

<table>
<thead>
<tr>
<th>Mark (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 &lt; $x$ \leq 40</td>
</tr>
<tr>
<td>40 &lt; $x$ \leq 60</td>
</tr>
<tr>
<td>60 &lt; $x$ \leq 75</td>
</tr>
<tr>
<td>75 &lt; $x$ \leq 85</td>
</tr>
<tr>
<td>85 &lt; $x$ \leq 95</td>
</tr>
<tr>
<td>95 &lt; $x$ \leq 100</td>
</tr>
</tbody>
</table>

a Use the information in the table to copy and complete the histogram.
b Use the information in the histogram to find the missing frequency from the table.

Edexcel, Question 6, Paper 13A Higher, March 2004
6. Jack and Jill are doing a survey on fast food.
   a. This is one of Jack’s questions.
   
   Burgers are bad for you and make you fat.
   Yes ☐ No ☐
   
   Give two reasons why this is not a good question.
   b. This is one of Jill’s questions.
   
   How many times, on average, do you visit a fast food outlet in a week?
   Never ☐ 1 or 2 times ☐ 3 or 4 times ☐ More than 4 times ☐
   
   Give two reasons why this is a good question.

7. A shop sells DVD players. The table shows the number of DVD players sold in every three-month period from January 2003 to June 2004.

<table>
<thead>
<tr>
<th>Year</th>
<th>Months</th>
<th>Number of DVD players sold</th>
</tr>
</thead>
<tbody>
<tr>

   a. Calculate the set of four-point moving averages for this data.
   b. What do your moving averages in part a tell you about the trend in the sale of DVD players?

8. A vet does a weekly check on the water animals at a zoo. There are 3 walruses, 146 penguins and 22 seals. The vet is required to see 10% of the animals and to see each type.

   a. What is this kind of sampling procedure called?
   b. How many each type of animal should the vet see?

9. The masses of 50 marrows are measured.

<table>
<thead>
<tr>
<th>Mass, m, (grams)</th>
<th>Frequency</th>
</tr>

<tr>
<td>1000 &lt; m ≤ 1250</td>
<td>15</td>
</tr>
</tbody>
</table>

   a. Draw a histogram to show this information
   b. Use your histogram, or otherwise, to estimate the median mass of the marrows.

10. The histogram shows the number of students at 320 different Junior schools in Wales.

   a. Find the median number of students at the schools.
   b. Find the interquartile range of the number of students at the schools.

11. This histogram shows the cricket scores of 100 Yorkshire League players.

   a. What is the median score?
   b. What is the interquartile range?
b This histogram is incomplete. It shows some of the cricket scores for 100 Lancashire League players. The median score is the same as for the Yorkshire players. The upper quartile for the Lancashire players is 50.

i What is the lower quartile for the Lancashire players?

ii Complete a possible histogram.

**WORKED EXAM QUESTION**

The distances travelled by 100 cars using 10 litres of petrol is shown in the histogram and table.

**a** Complete the histogram and the table.

**b** Estimate the number of cars that travel between 155 km and 185 km using 10 litres of petrol.

<table>
<thead>
<tr>
<th>Distance (km)</th>
<th>Frequency</th>
<th>Class width</th>
<th>Frequency density</th>
</tr>

<td>1.4</td>
</tr>
<tr>
<td>160–200</td>
<td>18</td>
<td>40</td>
<td>0.45</td>
</tr>
</tbody>
</table>

**Solution**

**a** Set up the table with columns for class width and frequency density and fill in the given information, reading frequency densities from the graph (be careful with scales).

Now fill in the rest of the information using

\[ f.d. = \frac{\text{frequency}}{\text{class width}} \]

frequency = f.d. x class width.

These values are shown in red.

Complete the graph.

**b** Draw lines at 155 and 185. The number of cars is represented by the area between these lines. In the 150–160 bar the area is \( \frac{1}{3} \) of the total. In the 160–200 bar the area is \( \frac{2}{3} \) of the total.

Number of cars = \( \frac{1}{3} \times 14 + \frac{2}{3} \times 18 = 18.25 \approx 18 \) cars
Mr Davies is a dairy farmer. Every month he records the thousands of litres of milk produced by his cows.
For his business plan he compares the amount of milk he produces in 2004 with 2005.

### 3-month moving averages for 2004 and 2005

- **Key**
  - 2004: 
  - 2005: 

For his business plan Mr Davies compares the amount of milk he produces in 2005, with the graphs showing the hours of sunshine and amount of rain that year.

Draw two scatter graphs; one showing his monthly milk production and monthly rainfall, the other showing his monthly milk production and the monthly sunshine.

Comment on the correlation shown by these graphs.
GRADE YOURSELF

- Able to find the mean from a frequency table of discrete data
- Able to draw a frequency polygon for discrete data
- Able to find an estimate of the mean from a grouped table of continuous data
- Able to draw a frequency polygon for continuous data
- Able to design questionnaires and surveys
- Able to use a moving average to predict future values
- Able to draw histograms from frequency tables with unequal class intervals
- Able to calculate the numbers to be surveyed for a stratified sample
- Able to find the median, quartiles and the interquartile range from a histogram

What you should know now

- Which average to use in different situations
- How to find the modal class and an estimated mean for continuous data
- How to draw frequency polygons and histograms for discrete and continuous data
- How to design questionnaires and surveys
This chapter will show you...

- how to expand two linear brackets to obtain a quadratic expression
- how to factorise a quadratic expression
- how to solve quadratic equations by factorisation, the quadratic formula and completing the square

What you should already know

- The basic language of algebra
- How to collect together like terms
- How to multiply together two algebraic expressions
- How to solve simple linear equations

Quick check  ➔ ANSWERS

1 Simplify the following.
   a \(-2x - x\)  b \(3x - x\)  c \(-5x + 2x\)
   d \(2m \times 3m\)  e \(3x \times -2x\)  f \(-4p \times 3p\)

2 Solve these equations.
   a \(x + 6 = 0\)  b \(2x + 1 = 0\)  c \(3x - 2 = 0\)
12.1 Expanding brackets

This section will show you how to:
- expand two linear brackets to obtain a quadratic expression

Key words
- coefficient
- linear
- quadratic
- expression

Quadratic expansion

A quadratic expression is one in which the highest power of the variables is 2. For example,

\[ y^2 \quad 3t^2 + 5t \quad 5m^2 + 3m + 8 \]

An expression such as \((3y + 2)(4y - 5)\) can be expanded to give a quadratic expression.

This multiplying out of such pairs of brackets is usually called quadratic expansion.

The rule for expanding expressions such as \((t + 5)(3t - 4)\) is similar to that for expanding single brackets: multiply everything in one bracket by everything in the other bracket.

There are several methods for doing this. Examples 1 to 3 show the three main methods, “expansion”, “FOIL” and “the box method”.

**EXAMPLE 1**

In the expansion method split up the first bracket and make each of its terms multiply the second bracket. We then simplify the outcome.

Expand \((x + 3)(x + 4)\).

\[
(x + 3)(x + 4) = x(x + 4) + 3(x + 4) \\
= x^2 + 4x + 3x + 12 \\
= x^2 + 7x + 12
\]

**EXAMPLE 2**

FOIL stands for First, Outer, Inner and Last. This is the order of multiplying the terms from each bracket.

Expand \((t + 5)(t - 2)\).

First terms give: \(t \times t = t^2\). Outer terms give: \(t \times -2 = -2t\).

Inner terms give: \(5 \times t = 5t\). Last terms give: \(+5 \times -2 = -10\).

\[(t + 5)(t - 2) = t^2 - 2t + 5t - 10 \\
= t^2 + 3t - 10\]
EXAMPLE 3

The box method is similar to that used to do long multiplication.

Expand \((k - 3)(k - 2)\).

\[(k - 3)(k - 2) = k^2 - 2k - 3k + 6\]

\[= k^2 - 5k + 6\]

Warning: Be careful with the signs. This is the main place where marks are lost in examination questions involving the expansion of brackets.

EXERCISE 12A

Expand the following expressions.

1. \((x + 3)(x + 2)\)
2. \((x + 4)(x + 3)\)
3. \((w + 1)(w + 3)\)
4. \((m + 5)(m + 1)\)
5. \((k + 3)(k + 5)\)
6. \((a + 4)(a + 1)\)
7. \((x + 4)(x - 2)\)
8. \((x + 5)(x - 3)\)
9. \((w + 3)(w - 1)\)
10. \((f + 2)(f - 3)\)
11. \((g + 1)(g - 4)\)
12. \((y + 4)(y - 3)\)
13. \((x - 3)(x + 4)\)
14. \((p - 2)(p + 1)\)
15. \((k - 4)(k + 2)\)
16. \((y - 2)(y + 5)\)
17. \((a - 1)(a + 3)\)
18. \((t - 3)(t + 4)\)
19. \((x + 3)(x - 3)\)
20. \((t + 5)(t - 5)\)
21. \((m + 4)(m - 4)\)
22. \((t + 2)(t - 2)\)
23. \((y + 8)(y - 8)\)
24. \((p + 1)(p - 1)\)
25. \((5 + x)(5 - x)\)
26. \((7 + g)(7 - g)\)
27. \((x - 6)(x + 6)\)

The expansions of the expressions below follow a pattern. Work out the first few and try to spot the pattern that will allow you immediately to write down the answers to the rest.

A common error is to get minus signs wrong. 
\(-2 \times -3 = +6\)

All the algebraic terms in \(x^2\) in Exercise 12A have a coefficient of 1 or –1. The next two examples show you what to do if you have to expand brackets containing terms in \(x^2\) whose coefficients are not 1 or –1.

EXAMPLE 4

Expand \((2t + 3)(3t + 1)\).

\[(2t + 3)(3t + 1) = 6t^2 + 2t + 9t + 3\]

\[= 6t^2 + 11t + 3\]

Hints and Tips

Use whichever method you prefer. There is no fixed method in GCSE examinations. Examiners give credit for all methods.

Hints and Tips

A common error is to get minus signs wrong. 
\(-2 \times -3 = +6\)
Expand the following expressions:

1. \((2 x + 3)(3 x + 1)\)
2. \((3 y + 2)(4 y + 3)\)
3. \((3 t + 1)(2 t + 5)\)
4. \((4 t + 3)(2 t - 1)\)
5. \((5 m + 2)(2m - 3)\)
6. \((4 k + 3)(3k - 5)\)
7. \((3p - 2)(2p + 5)\)
8. \((5w + 2)(2w + 3)\)
9. \((2a - 3)(3a + 1)\)
10. \((4r - 3)(2r - 1)\)
11. \((3g - 2)(5g - 2)\)
12. \((4d - 1)(3d + 2)\)
13. \((5 + 2p)(3 + 4p)\)
14. \((2 + 3t)(1 + 2t)\)
15. \((6 + 5t)(1 - 2t)\)
16. \((4 + 3n)(3 - 2n)\)
17. \((2 + 3f)(2f - 3)\)
18. \((3 - 2q)(4 + 5q)\)
19. \((1 - 3p)(3 + 2p)\)
20. \((4 - 2t)(3t + 1)\)

Try to spot the pattern in each of the following expressions so that you can immediately write down the expansion:

1. \((2 x + 1)(2 x - 1)\)
2. \((3 t + 2)(3 t - 2)\)
3. \((5 y + 3)(5 y - 3)\)
4. \((4 m + 3)(4 m - 3)\)
5. \((2 k - 3)(2k + 3)\)
6. \((4 k - 1)(4k + 1)\)
7. \((2 + 3x)(2 - 3x)\)
8. \((5 + 2t)(5 - 2t)\)
9. \((6 - 5y)(6 + 5y)\)
10. \((a + b)(a - b)\)
11. \((3 t + k)(3t - k)\)
12. \((2m - 3p)(2m + 3p)\)
13. \((5k + g)(5k - g)\)
14. \((ab + cd)(ab - cd)\)
15. \((a^2 + b^2)(a^2 - b^2)\)
Expanding squares

Whenever you see a linear bracket squared you must write the bracket down twice and then use whichever method you prefer to expand the brackets.

**EXAMPLE 6**

Expand \((x + 3)^2\).

\[
(x + 3)^2 = (x + 3)(x + 3)
\]

\[
= x(x + 3) + 3(x + 3)
\]

\[
= x^2 + 3x + 3x + 9
\]

\[
= x^2 + 6x + 9
\]

**EXAMPLE 7**

Expand \((3x - 2)^2\).

\[
(3x - 2)^2 = (3x - 2)(3x - 2)
\]

\[
= 9x^2 - 6x - 6x + 4
\]

\[
= 9x^2 - 12x + 4
\]

**EXERCISE 12D**

Expand the following squares.

- \((x + 3)^2\)
- \((m + 4)^2\)
- \((6 + t)^2\)
- \((3 + p)^2\)
- \((m - 3)^2\)
- \((t - 5)^2\)
- \((4 - m)^2\)
- \((7 - k)^2\)
- \((3x + 1)^2\)
- \((4r + 3)^2\)
- \((2 + 5y)^2\)
- \((3x - 2)^2\)
- \((2 - 5t)^2\)
- \((4r - 3)^2\)
- \((3x - 2)^2\)
- \((2 + 5y)^2\)
- \((x + y)^2\)
- \((m - n)^2\)
- \((2r + y)^2\)
- \((x + 2)^2\)
- \((x - 5)^2 - 25\)
- \((x + 6)^2 - 36\)
- \((x - 2)^2 - 4\)

Remember always write down the bracket twice. Do not try to take any short cuts.
Factorisation involves putting a quadratic expression back into its brackets (if possible). We start with the factorisation of quadratic expressions of the type

\[ x^2 + ax + b \]

where \(a\) and \(b\) are integers.

Sometimes it is easy to put a quadratic expression back into its brackets, other times it seems hard. However, there are some simple rules that will help you to factorise.

- Each bracket will start with an \(x\), and the signs in the quadratic expression show which signs to put after the \(x\).
- When the second sign in the expression is a plus, both bracket signs are the same as the first sign.
  
  \[ x^2 + ax + b = (x + ?)(x + ?) \]  
  Since everything is positive.
  
  \[ x^2 - ax + b = (x - ?)(x - ?) \]  
  Since \(-ve \times -ve = +ve\).

- When the second sign is a minus, the bracket signs are different.
  
  \[ x^2 + ax - b = (x + ?)(x - ?) \]  
  Since \(+ve \times -ve = -ve\).
  
  \[ x^2 - ax - b = (x + ?)(x - ?) \]

- Next, look at the last number, \(b\), in the expression. When multiplied together, the two numbers in the brackets must give \(b\).

- Finally, look at the coefficient of \(x\) number, \(a\). The sum of the two numbers in the brackets will give \(a\).

**EXAMPLE 8**

Factorise \(x^2 - x - 6\).

Because of the signs we know the brackets must be \((x + ?)(x - ?)\).

Two numbers that have a product of \(-6\) and a sum of \(-1\) are \(-3\) and \(+2\).

So, \(x^2 - x - 6 = (x + 2)(x - 3)\)
Factorise the following.

\[
x^2 + 5x + 6
\]
\[
p^2 + 14p + 24
\]
\[
a^2 + 8a + 12
\]
\[
t^2 - 5t + 6
\]
\[
c^2 - 18c + 32
\]
\[
p^2 - 8p + 15
\]
\[
x^2 + 3x - 10
\]
\[
n^2 - 3n - 18
\]
\[
t^2 - t - 90
\]
\[
d^2 + 2d + 1
\]
\[
x^2 - 24x + 144
\]

\[
x^2 - 5x + 6
\]
\[
r^2 + 9r + 18
\]
\[
k^2 + 10k + 21
\]
\[
d^2 - 5d + 4
\]
\[
t^2 + 5t + 6
\]
\[
c^2 - 13t + 36
\]
\[
y^2 + 5y - 6
\]
\[
r^2 - 4m - 12
\]
\[
m^2 - 7m - 44
\]
\[
t^2 - 2t - 63
\]
\[
y^2 + 20y + 100
\]
\[
d^2 - d - 12
\]
\[
t^2 - t - 20
\]

\[
k^2 + 10k + 24
\]
\[
x^2 + 7x + 12
\]
\[
q^2 + 22q + 21
\]
\[
x^2 - 10x + 25
\]
\[
f^2 + 22f + 21
\]
\[
x^2 - 5x + 4
\]
\[
q^2 - 7q + 10
\]
\[
y^2 - 16y + 48
\]
\[
x^2 - 15x + 36
\]
\[
y^2 - 16y + 48
\]
\[
t^2 + 10t + 16
\]
\[
x^2 + 7x + 12
\]
\[
m^2 - 18m + 81
\]

\[
x^2 - 24x + 144
\]

\[
x^2 - 25
\]
\[
x^2 - 4
\]
\[
x^2 - 100
\]

\[\equiv\]

This type of expansion is known as an identity which is what the sign ‘\(\equiv\)’ represents. It means it is true for all values of \(a\) and \(b\). This expansion gives two perfect squares separated by a minus sign and is known as the difference of two squares. You should have found that all the expansions in Exercise 12C are the differences of two squares.

The exercise illustrates a system of factorisation that will always work for the difference of two squares such as these.

- Recognise the pattern of the expression as \(x^2\) minus a square number \(n^2\).
- Its factors are \((x + n)(x - n)\).
Each of these is the difference of two squares. Factorise them.

1. \(x^2 - 9\)
2. \(t^2 - 25\)
3. \(m^2 - 16\)
4. \(9 - x^2\)
5. \(49 - t^2\)
6. \(k^2 - 100\)
7. \(4 - y^2\)
8. \(x^2 - 64\)
9. \(9x^2 - 1\)
10. \(x^2 - y^2\)
11. \(x^2 - 4y^2\)
12. \(16x^2 - 9\)
13. \(4x^2 - 9y^2\)
14. \(9t^2 - 4w^2\)
15. \(t^2 - 81\)
16. \(x^2 - 9y^2\)
17. \(25x^2 - 64\)
18. \(16y^2 - 25x^2\)

Factorising \(ax^2 + bx + c\)

We can adapt the method for factorising \(x^2 + ax + b\) to take into account the factors of the coefficient of \(x^2\).
EXAMPLE 12

Factorise $3x^2 + 8x + 4$.

- First we note that both signs are positive. So both bracket signs must be $(?x + ?)(?x + ?)$
- As 3 has only 3 x 1 as factors, the brackets must be $(3x + ?)(x + ?)$
- Next, we note that the factors of 4 are 4 x 1 and 2 x 2.
- We now have to find which pair of factors of 4 combine with 3 x 1 to give 8.

<table>
<thead>
<tr>
<th>2</th>
<th>4</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

We see that the combination $3 \times 2$ and $1 \times 2$ adds up to 8.

- So, the complete factorisation becomes $(3x + 2)(x + 2)$.

EXAMPLE 13

Factorise $6x^2 - 7x - 10$.

- First we note that both signs are negative. So both bracket signs must be $(?x + ?)(?x - ?)$
- As 6 has 6 x 1 and 3 x 2 as factors, the brackets could be $(6x \pm ?)(x \pm ?)$ or $(3x \pm ?)(2x \pm ?)$
- Next, we note that the factors of 10 are 5 x 2 and 1 x 10.
- We now have to find which pair of factors of 10 combine with the factors of 6 to give $-7$.

<table>
<thead>
<tr>
<th>3</th>
<th>6</th>
<th>±1</th>
<th>±2</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>1</td>
<td>±10</td>
<td>±5</td>
</tr>
</tbody>
</table>

We see that the combination $6 \times -2$ and $1 \times 5$ adds up to $-7$.

- So, the complete factorisation becomes $(6x + 5)(x - 2)$.

Although this seems to be very complicated, it becomes quite easy with practice and experience.

EXERCISE 12G

Factorise the following expressions.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>$2x^2 + 5x + 2$</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>$24x^2 + 19x + 2$</td>
<td>5</td>
</tr>
<tr>
<td>7</td>
<td>$6y^2 + 33y - 63$</td>
<td>8</td>
</tr>
<tr>
<td>10</td>
<td>$6t^2 + 13t + 5$</td>
<td>11</td>
</tr>
</tbody>
</table>
12.3 Solving quadratic equations by factorisation

This section will show you how to:

- solve a quadratic equation by factorisation

Key words
factors
solve

Solving the quadratic equation \(x^2 + ax + b = 0\)

To solve a quadratic equation such as \(x^2 - 2x - 3 = 0\), you first have to be able to factorise it. Follow through Examples 14 to 16 below to see how this is done.

**EXAMPLE 14**

Solve \(x^2 + 6x + 5 = 0\).

This factorises into \((x + 5)(x + 1) = 0\).

The only way this expression can ever equal 0 is if the value of one of the brackets is 0.

Hence either \((x + 5) = 0\) or \((x + 1) = 0\)

\[\Rightarrow x + 5 = 0 \quad \text{or} \quad x + 1 = 0\]

\[\Rightarrow x = -5 \quad \text{or} \quad x = -1\]

So the solution is \(x = -5\) or \(x = -1\).

**EXAMPLE 15**

Solve \(x^2 + 3x - 10 = 0\).

This factorises into \((x + 5)(x - 2) = 0\).

Hence \(x + 5 = 0\) or \(x - 2 = 0\)

\[\Rightarrow x = -5 \quad \text{or} \quad x = 2\]

So the solution is \(x = -5\) or \(x = 2\).

**EXAMPLE 16**

Solve \(x^2 - 6x + 9 = 0\).

This factorises into \((x - 3)(x - 3) = 0\).

The equation has repeated roots, that is \((x - 3)^2 = 0\).

Hence, there is only one solution, \(x = 3\).
Solve these equations.

\( (x + 2)(x + 5) = 0 \)
\( (x + 3)(x - 2) = 0 \)
\( (x - 1)(x + 2) = 0 \)
\( (x - 3)(x - 2) = 0 \)

\( (t + 3)(t + 1) = 0 \)
\( (t + 1)(t - 3) = 0 \)
\( (t - 2)(t + 5) = 0 \)
\( (t - 1)(t - 5) = 0 \)

\( (a + 6)(a + 4) = 0 \)
\( (a + 4)(a - 3) = 0 \)

First factorise, then solve these equations.

\( x^2 + 5x + 4 = 0 \)
\( x^2 - 8x + 15 = 0 \)
\( t^2 + 4t - 12 = 0 \)
\( x^2 + 4x + 4 = 0 \)
\( t^2 + 8t + 12 = 0 \)

\( x^2 + 11x + 18 = 0 \)
\( x^2 - 3x - 10 = 0 \)
\( t^2 + 3t - 18 = 0 \)
\( m^2 + 10m + 25 = 0 \)
\( k^2 - 2k - 15 = 0 \)

\( x^2 - 6x + 8 = 0 \)
\( x^2 - 2x - 15 = 0 \)
\( t^2 - x - 2 = 0 \)
\( t^2 - 8t + 16 = 0 \)
\( a^2 - 14a + 49 = 0 \)

First rearrange these equations, then solve them.

\( x^2 + 10x = -24 \)
\( x^2 + 2x = 24 \)
\( t^2 + 7t = 30 \)
\( t^2 - t = 72 \)

\( x^2 - 18x = -32 \)
\( x^2 + 3x = 54 \)
\( x^2 - 7x = 44 \)
\( x^2 = 17x - 72 \)

\( x^2 + 1 = 2x \)

Solving the general quadratic equation by factorisation

The general quadratic equation is of the form \( ax^2 + bx + c = 0 \) where \( a, b \) and \( c \) are positive or negative whole numbers. (It is easier to make sure that \( a \) is always positive). Before any quadratic equation can be solved it must be rearranged to this form.

The method is similar to that used to solve equations of the form \( x^2 + ax + b = 0 \). That is, we have to find two factors of \( ax^2 + bx + c \) whose product is 0.
CHAPTER 12: ALGEBRA 2

EXAMPLE 17

Solve these quadratic equations.  

a  \(12x^2 - 28x = -15\)  

b  \(30x^2 - 5x - 5 = 0\)

a  First, rearrange the equation to the general form.  

\[12x^2 - 28x + 15 = 0\]

This factorises into \((2x - 3)(6x - 5) = 0\).

The only way this product can equal 0 is if the value of one of the brackets is 0. Hence,  

either \(2x - 3 = 0\) or \(6x - 5 = 0\)

\[\Rightarrow 2x = 3 \quad \text{or} \quad 6x = 5\]

\[\Rightarrow x = \frac{3}{2} \quad \text{or} \quad x = \frac{5}{6}\]

So the solution is \(x = \frac{3}{2}\) or \(x = \frac{5}{6}\).

Note: It is almost always the case that if a solution is a fraction which is then changed into a rounded-off decimal number, the original equation cannot be evaluated exactly using that decimal number. So it is preferable to leave the solution in its fraction form. This is called the rational form (see page 224).

b  This equation is already in the general form and it will factorise to \((15x + 5)(2x - 1) = 0\)  
or \((3x + 1)(10x - 5) = 0\).

Look again at the equation. There is a common factor of 5 which can be factorised out to give  

\[5(6x^2 - x - 1 = 0)\]

This is much easier to factorise to \(5(3x + 1)(2x - 1) = 0\), which can be solved to give  

\(x = -\frac{1}{3}\) or \(x = \frac{1}{2}\).

Sometimes the values of \(b\) and \(c\) are zero. (Note that if \(a\) is zero the equation is no longer a quadratic equation but a linear equation. These were covered in Chapter 5.)

EXAMPLE 18

Solve these quadratic equations.  

a  \(3x^2 - 4 = 0\)  

b  \(4x^2 - 25 = 0\)  

c  \(6x^2 - x = 0\)

a  Rearrange to get \(3x^2 = 4\).  

Divide both sides by 3:  

\[x^2 = \frac{4}{3}\]

Square root both sides:  

\[x = \pm \frac{\sqrt{4}}{\sqrt{3}} = \pm \frac{2}{\sqrt{3}}\]

Note: A square root can be positive or negative. The answer is in surd form (see Chapter 10).

b  You can use the method of part a or you should recognise this as the difference of two squares (page 225). This can be factorised to \((2x - 5)(2x + 5) = 0\).

Each bracket can be put equal to zero.  

\[2x - 5 = 0 \quad \Rightarrow \quad x = \frac{5}{2}\]

\[2x + 5 = 0 \quad \Rightarrow \quad x = -\frac{5}{2}\]

So the solution is \(x = \pm \frac{5}{2}\).

c  There is a common factor of \(x\), so factorise as \(x(6x - 1) = 0\).

There is only one bracket this time but each factor can be equal to zero, so \(x = 0\) or \(6x - 1 = 0\).

Hence \(x = 0\) or \(\frac{1}{6}\).
Solve the following equations.

1. \[ 3x^2 + 8x - 3 = 0 \]
2. \[ 5x^2 - 9x - 2 = 0 \]
3. \[ 18t^2 + 9t + 1 = 0 \]
4. \[ 6x^2 + 15x - 9 = 0 \]
5. \[ 28x^2 - 85x + 63 = 0 \]
6. \[ 4x^2 + 9x = 0 \]
7. \[ 6x^2 + 15x + 1 = 0 \]
8. \[ 3t^2 - 4t - 35 = 0 \]
9. \[ 5x^2 - 9x - 2 = 0 \]
10. \[ 18t^2 + 9t + 1 = 0 \]
11. \[ 6x^2 + 15x - 9 = 0 \]
12. \[ 28x^2 - 85x + 63 = 0 \]
13. \[ 4x^2 + 9x = 0 \]

Rearrange into the general form then solve the following equations.

1. \[ x^2 - x = 42 \]
2. \[ 8x(x + 1) = 30 \]
3. \[ 13x^2 = 11 - 2x \]
4. \[ (x + 1)(x - 2) = 4 \]
5. \[ 8x^2 + 6x + 3 = 2x^2 + x + 2 \]
6. \[ 25x^2 = 10 - 45x \]
7. \[ (2x + 1)(5x + 2) = (2x - 2)(x - 2) \]
8. \[ 5x + 5 = 30x^2 + 15x + 5 \]
9. \[ 6x^2 + 30 = 5 - 3x^2 - 30x \]
10. \[ 4x^2 + 4x - 49 = 4x \]

Many quadratic equations cannot be solved by factorisation because they do not have simple factors. Try to factorise, for example, \[ x^2 - 4x - 3 = 0 \] or \[ 3x^2 - 6x + 2 = 0 \]. You will find it is impossible.

One way to solve this type of equation is to use the quadratic formula. This formula can be used to solve any quadratic equation that is soluble. (Some are not, which the quadratic formula would immediately show. See section 12.6.)

The solution of the equation \[ ax^2 + bx + c = 0 \] is given by:

\[
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
\]
This is the quadratic formula. It is given on the formula sheet of GCSE exams but it is best to learn it.

The symbol ± states that the square root has a positive and a negative value, both of which must be used in solving for \(x\).

**Example 19**

Solve \(5x^2 - 11x - 4 = 0\), correct to two decimal places.

Take the quadratic formula:

\[
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
\]

and put \(a = 5\), \(b = -11\) and \(c = -4\), which gives:

\[
x = \frac{-(-11) \pm \sqrt{(-11)^2 - 4(5)(-4)}}{2(5)}
\]

Note that the values for \(a\), \(b\) and \(c\) have been put into the formula in brackets. This is to avoid mistakes in calculation. It is a very common mistake to get the sign of \(b\) wrong or to think that \(-11^2\) is \(-121\). Using brackets will help you do the calculation correctly.

\[
x = \frac{11 \pm \sqrt{121 + 80}}{10} = \frac{11 \pm \sqrt{201}}{10}
\]

\[
\Rightarrow x = 2.52 \text{ or } -0.32
\]

**Note:** The calculation has been done in stages. With a calculator it is possible just to work out the answer, but make sure you can use your calculator properly. If not, break the calculation down. Remember the rule “If you try to do two things at once, you will probably get one of them wrong”.

**Examination tip:** If you are asked to solve a quadratic equation to one or two decimal places, you can be sure that it can be solved only by the quadratic formula.

**Exercise 12J**

Solve the following equations using the quadratic formula.

Give your answers to 2 decimal places.

1. \(2x^2 + x - 8 = 0\)
2. \(3x^2 + 5x + 1 = 0\)
3. \(x^2 - x - 10 = 0\)
4. \(5x^2 + 2x - 1 = 0\)
5. \(7x^2 + 12x + 2 = 0\)
6. \(3x^2 + 11x + 9 = 0\)
7. \(4x^2 + 9x + 3 = 0\)
8. \(6x^2 + 22x + 19 = 0\)
9. \(x^2 + 3x - 6 = 0\)
10. \(3x^2 - 7x + 1 = 0\)
11. \(2x^2 + 11x + 4 = 0\)
12. \(4x^2 + 5x - 3 = 0\)
13. \(4x^2 - 9x + 4 = 0\)
14. \(7x^2 + 3x - 2 = 0\)
15. \(5x^2 - 10x + 1 = 0\)
Another method for solving quadratic equations is **completing the square**. This method can be used to give answers to a specified number of decimal places or to leave answers in **surd** form.

You will remember that:

\[(x + a)^2 = x^2 + 2ax + a^2\]

which gives:

\[x^2 + 2ax = (x + a)^2 - a^2\]

This is the basic principle behind completing the square.

### EXAMPLE 20

Rewrite \(x^2 + 4x - 7\) in the form \((x + a)^2 - b\). Hence solve the equation \(x^2 + 4x - 7 = 0\), giving your answers to 2 decimal places.

We note that:

\[x^2 + 4x = (x + 2)^2 - 4\]

So, we have:

\[x^2 + 4x - 7 = (x + 2)^2 - 4 - 7 = (x + 2)^2 - 11\]

When \(x^2 + 4x - 7 = 0\), we can rewrite the equations using completing the square, as \((x + 2)^2 - 11 = 0\).

Rearranging gives \((x + 2)^2 = 11\)

Taking the **square root** of both sides gives

\[x + 2 = \pm \sqrt{11}\]

\[\Rightarrow x = -2 \pm \sqrt{11}\]

This answer is in surd form and could be left like this, but we are asked to evaluate it to \(x = 1.32\) or \(-5.32\) (to 2 decimal places).
Write an equivalent expression in the form \((x \pm a)^2 - b\).

\[ax^2 + 4x - 1 = 0\] by completing the square. Leave your answer in the form \(a \pm \sqrt{b}\).

\[x^2 - 6x = (x - 3)^2 - 9\]

So \(x^2 - 6x - 1 = (x - 3)^2 - 9 - 1 = (x - 3)^2 - 10\)

When \(x^2 - 6x - 1 = 0\), then \((x - 3)^2 - 10 = 0\)

\[\Rightarrow (x - 3)^2 = 10\]

Taking the square root of both sides gives:

\[x - 3 = \pm \sqrt{10}\]

\[\Rightarrow x = 3 \pm \sqrt{10}\]

**Exercise 12K**

1. Write an equivalent expression in the form \((x \pm a)^2 - b\).
   - a) \(x^2 + 4x\)
   - b) \(x^2 + 14x\)
   - c) \(x^2 - 6x\)
   - d) \(x^2 + 6x\)
   - e) \(x^2 - 4x\)
   - f) \(x^2 + 3x\)
   - g) \(x^2 - 5x\)
   - h) \(x^2 + x\)
   - i) \(x^2 + 10x\)
   - j) \(x^2 + 7x\)
   - k) \(x^2 - 2x\)
   - l) \(x^2 + 2x\)

2. Write an equivalent expression in the form \((x \pm a)^2 - b\).
   - Question 1 will help with a to h.
   - a) \(x^2 + 4x - 1\)
   - b) \(x^2 + 14x - 5\)
   - c) \(x^2 - 6x + 3\)
   - d) \(x^2 + 6x + 7\)
   - e) \(x^2 - 4x - 1\)
   - f) \(x^2 + 3x + 3\)
   - g) \(x^2 - 5x - 5\)
   - h) \(x^2 + x - 1\)
   - i) \(x^2 + 8x - 6\)
   - j) \(x^2 + 2x - 1\)
   - k) \(x^2 - 2x - 7\)
   - l) \(x^2 + 2x - 9\)

3. Solve the following equations by completing the square. Leave your answers in surd form where appropriate. The answers to question 2 will help.
   - a) \(x^2 + 4x - 1 = 0\)
   - b) \(x^2 + 14x - 5 = 0\)
   - c) \(x^2 - 6x + 3 = 0\)
   - d) \(x^2 + 6x + 7 = 0\)
   - e) \(x^2 - 4x - 1 = 0\)
   - f) \(x^2 + 3x + 3 = 0\)
   - g) \(x^2 - 5x - 5 = 0\)
   - h) \(x^2 + x - 1 = 0\)
   - i) \(x^2 + 8x - 6 = 0\)
   - j) \(x^2 + 2x - 1 = 0\)
   - k) \(x^2 - 2x - 7 = 0\)
   - l) \(x^2 + 2x - 9 = 0\)

4. Solve by completing the square. Give your answers to two decimal places.
   - a) \(x^2 + 2x - 5 = 0\)
   - b) \(x^2 - 4x - 7 = 0\)
   - c) \(x^2 + 2x - 9 = 0\)

5. Prove that the solutions to the equation \(x^2 + bx + c = 0\) are

\[-\frac{b}{2} \pm \sqrt{\left(\frac{b^2}{4} - c\right)}\]
12.6 Problems using quadratic equations

This section will show you why:
- some quadratic equations do not factorise and explain how to solve practical problems using quadratic equations

Key word
discriminant

Quadratic equations with no solution

The quantity \((b^2 - 4ac)\) in the quadratic formula is known as the **discriminant**.

When \(b^2 > 4ac\), \((b^2 - 4ac)\) is positive. This has been the case in almost all of the quadratics you have solved so far and it means there are two solutions.

When \(b^2 = 4ac\), \((b^2 - 4ac)\) is zero. This has been the case in some of the quadratics you have solved so far. It means there is only one solution (the repeated root).

When \(b^2 < 4ac\), \((b^2 - 4ac)\) is negative. So its square root is that of a negative number.

Such a square root cannot be found (at GCSE level) and therefore there are no solutions. You will not be asked about this in examinations but if it happens then you will have made a mistake and should check your working.

**EXAMPLE 22**

Find the discriminant \(b^2 - 4ac\) of the equation \(x^2 + 3x + 5 = 0\) and explain what the result tells you.

\[b^2 - 4ac = (3)^2 - 4(1)(5) = 9 - 20 = -11.\]

This means there are no solutions for \(x\).

**EXERCISE 12L**

Work out the discriminant \(b^2 - 4ac\) of the following equations. In each case say how many solutions the equation has.

1. \(3x^2 + 2x - 4 = 0\)
2. \(2x^2 - 7x - 2 = 0\)
3. \(5x^2 - 8x + 2 = 0\)
4. \(3x^2 + x - 7 = 0\)
5. \(16x^2 - 23x + 6 = 0\)
6. \(x^2 - 2x - 16 = 0\)
7. \(5x^2 + 5x + 3 = 0\)
8. \(4x^2 + 3x + 2 = 0\)
9. \(5x^2 - x - 2 = 0\)
10. \(x^2 + 6x - 1 = 0\)
11. \(17x^2 - x + 2 = 0\)
12. \(x^2 + 5x - 3 = 0\)
Using the quadratic formula without a calculator

In the non-calculator paper, you could be asked to solve a quadratic equation that does not factorise. The clue would be that you would be asked to leave your answer in root or surd form. You could use completing the square but this gets very messy if the coefficient of $x^2$ is not 1 and/or the coefficient of $x$ is not an even number. In these cases the quadratic formula is easier to use.

**EXAMPLE 23**

Solve the equation $x^2 - 5x - 5 = 0$. Give your answer in the form $a \pm \sqrt{b}$.

Using the quadratic formula gives:

$$x = \frac{-(-5) \pm \sqrt{(-5)^2 - 4(1)(-5)}}{2(1)}$$

$$x = \frac{5 \pm \sqrt{45}}{2} = \frac{5}{2} \pm \frac{3\sqrt{5}}{2}$$

**EXAMPLE 24**

Solve the equation $2x^2 + 6x - 5 = 0$. Give your answer in surd form.

Using the quadratic formula gives:

$$x = \frac{-6 \pm \sqrt{76}}{4} = \frac{-6 \pm 2\sqrt{19}}{4} = \frac{-3 \pm \sqrt{19}}{2}$$

**EXERCISE 12M**

1. Solve the following equations by the quadratic formula. Give your answers in the form $a \pm \sqrt{b}$.

   a. $x^2 - 2x - 4 = 0$
   b. $x^2 + 2x - 7 = 0$
   c. $x^2 + 4x - 44 = 0$
   d. $x^2 + 2x - 6 = 0$
   e. $x^2 - 8x + 2 = 0$
   f. $x^2 - 4x + 2 = 0$

2. Solve the following equations by the quadratic formula. Give your answers in surd form.

   a. $2x^2 + 4x - 5 = 0$
   b. $2x^2 + 4x - 7 = 0$
   c. $2x^2 + 6x - 5 = 0$
   d. $2x^2 - 5x - 8 = 0$
   e. $5x^2 + x - 3 = 0$
   f. $2x^2 + 3x - 3 = 0$

Problems solved by quadratic equations

You are likely to have to solve a problem which involves generating a quadratic equation and finding its solution.
EXAMPLE 25
Find the sides of the right-angled triangle shown in the diagram.
Applying the theorem of Pythagoras gives:
\[(x + 5)^2 + (x - 2)^2 = 13^2\]
\[(x^2 + 10x + 25) + (x^2 - 4x + 4) = 169\]
\[2x^2 + 6x + 29 = 169\]
\[2x^2 + 6x - 140 = 0\]
Divide by a factor of 2: \[x^2 + 3x - 70 = 0\]
This factorises to \[(x + 10)(x - 7) = 0\]
Giving \[x = -10\] or \[7\]. We reject the negative value as it would give negative lengths.
Hence the sides of the triangle are 5, 12 and 13.
Note: You may know the Pythagorean triple 5, 12, 13 and guessed the answer but you would be expected to show working. Most "real-life" problems will end up with a quadratic that factorises as the questions are complicated enough without expecting you to use the quadratic formula or completing the square.

EXAMPLE 26
Solve this equation. \[2x^2 = 5\]
Multiply through by \[x\] to give: \[2x^2 - 3 = 5x\]
Rearrange into the general form: \[2x^2 - 5x - 3 = 0\]
This factorises to: \[(2x + 1)(x - 3) = 0\]
So \[x = -\frac{1}{2}\] or \[x = 3\].

EXAMPLE 27
A coach driver undertook a journey of 300 km. Her actual average speed turned out to be 10 km/h slower than expected. Therefore, she took 1 hour longer over the journey than expected. Find her actual average speed.
Let the driver's actual average speed be \[x\] km/h. So the estimated speed would have been \[(x + 10)\] km/h.
Time taken = \[\frac{\text{Distance travelled}}{\text{Speed}}\]
At \[x\] km/h, she did the journey in \[\frac{300}{x}\] hours.
At \[(x + 10)\] km/h, she would have done the journey in \[\frac{300}{x + 10}\] hours.
Since the journey took 1 hour longer than expected, then
\[\text{time taken} = \frac{300}{x + 10} + 1 = \frac{300 + x + 10}{x + 10} = \frac{310 + x}{x + 10}\]
So \[= \frac{300}{x} = \frac{310 + x}{x + 10} \Rightarrow 300(x + 10) = (310 + x) \Rightarrow 300x + 3000 = 310x + x^2\]
Rearranging into the general form gives: \[x^2 + 10x - 3000 = 0\]
This factorises into: \[(x + 60)(x - 50) = 0 \Rightarrow x = -60\] or \[50\]
The coach's average speed could not be \(-60\) km/h, so it has to be 50 km/h.
The sides of a right-angled triangle are \( x \), \((x + 2)\) and \((2x - 2)\). The hypotenuse is length \((2x - 2)\). Find the actual dimensions of the triangle.

The length of a rectangle is 5 m more than its width. Its area is 300 m\(^2\). Find the actual dimensions of the rectangle.

The average weight of a group of people is 45.2 kg. A newcomer to the group weighs 51 kg, which increases the average weight by 0.2 kg. How many people are now in the group?

Solve the equation \( x + \frac{3}{x} = 7 \). Give your answers correct to 2 decimal places.

Solve the equation \( 2x + \frac{5}{x} = 11 \).

A tennis court has an area of 224 m\(^2\). If the length were decreased by 1 m and the width increased by 1 m, the area would be increased by 1 m\(^2\). Find the dimensions of the court.

On a journey of 400 km, the driver of a train calculates that if he were to increase his average speed by 2 km/h, he would take 20 minutes less. Find his average speed.

The difference of the squares of two positive numbers, whose difference is 2, is 184. Find these two numbers.

The length of a carpet is 1 m more than its width. Its area is 9 m\(^2\). Find the dimensions of the carpet to 2 decimal places.

The two shorter sides of a right-angled triangle differ by 2 cm. The area is 24 cm\(^2\). Find the shortest side of the triangle.

Helen worked out that she could save 30 minutes on a 45 km journey if she travelled at an average speed which was 15 km/h faster than that at which she had planned to travel. Find the speed at which Helen had originally planned to travel.

Claire intended to spend £3.20 on balloons for her party. But each balloon cost her 2p more than she expected, so she had to buy 8 fewer balloons. Find the cost of each balloon.

The sum of a number and its reciprocal is 2.05. What are the two numbers?

A woman buys goods for £60x and sells them for £(600 – 6x) at a loss of \( x \% \). Find \( x \).

A train has a scheduled time for its journey. If the train averages 50 km/h, it arrives 12 minutes early. If the train averages 45 km/h, it arrives 20 minutes late. Find how long the train should take for the journey.

A rectangular garden measures 15 m by 11 m and is surrounded by a path of uniform width whose area is 41.25 m\(^2\). Find the width of the path.
**Factorise**

a. \(8p - 6\)
b. \(r^2 + 6r\)
c. \(s^2 x^d\)

**Simplify**

a. \((x + 5)(x + 8)\)
b. \(x^2 - 5x - 14\)

**Factorise**

a. \(r^2 + 6r\)
b. \(s^2 x^d\)

c. \(a - 25\)

**Factorise**

a. \(3x^2 - 12y^2\)
b. \(3x^2 + 4x + 1\)

c. \(x^2 - 20x + 36 = 0\)

**Expand and simplify**

a. \((x + 5)(x + 8)\)
b. \(x^2 - 5x - 14\)

**Simplify**

a. Expand \((a + b)(a - b)\)
b. \(x^2 - 20x + 36 = 0\)

c. \(x^2 + 6x - 4 = 0\)

**Factorise**

a. \(2x^2 - 7x - 9\)
b. \(3x^2 + 4x + 1\)

c. \(5(x - 3)^2\)

**Hence or otherwise, find the value of**

\[5.36^2 + 2 \times 5.36 \times 4.64 + 4.64^2\]

**Solve**

\[x^2 + 3x - 5 = 0\]

Give your solutions correct to 4 significant figures.

**Find the values of**

a. \(a\) and \(b\) such that \(x^2 + 8x - 3 = (x + a)^2 + b\)

**Hence, or otherwise, solve the equation**

\[x^2 + 8x - 3 = 0\]

**Find**

a. \(p\) when \(q = 1 - 4\)

**Solve**

\[2(y - 2)^2 - 7(y - 2) - 9 = 0\]

**Solution**

**You are given that**

\[(2x + b)^2 + c = ax^2 - 4x - 5\]

**Calculate the values**

a. \(a, b\) and \(c\)

**You are given**

\[q = a(p + 3)^3, \text{ when } p = 7, q = 2.\]

**Find**

\[p\] when \(q = \frac{1}{2}\)

\[2000(p + 3)^3 = 8000\]

\[\frac{1}{4} = \frac{2000}{(p + 3)^3}\]

\[p + 3 = 20\]

\[p = 17\]
A garden designer sketches the following design for a client.

This is his notepad with the details of each area.

- **Patio** – paved
- **Play area** – raised, filled with woodchips
- **Flower beds** – raised, made from railway sleepers
- **Water feature** – 4 rectangular ponds, small waterfall between each.
  - Total volume of ponds: 73,800 litres
- **Each pond** – length of each one to be 2 m more than width
  - width of each one to be 1 m wider than the previous one
  - all 90 cm deep
  - width of first pond = \( x \) m
Help the designer to calculate:

<table>
<thead>
<tr>

Area of lawn
GRADE YOURSELF

Able to expand a pair of linear brackets to get a quadratic expression
Able to factorise a quadratic expression of the form $x^2 + ax + b$
Able to solve a quadratic equation of the form $x^2 + ax + b = 0$
Able to factorise a quadratic expression of the form $ax^2 + bx + c$
Able to solve a quadratic equation of the form $ax^2 + bx + c = 0$ by factorisation
Able to solve a quadratic equation of the form $ax^2 + bx + c = 0$ by the quadratic formula
Able to solve a quadratic equation using completing the square
Able to solve real-life problems that lead to a quadratic equation

What you should know now

• How to expand linear brackets
• How to solve quadratic equations by factorisation, the quadratic formula and completing the square
• How to set up practical problems using algebra to obtain a quadratic equation which can then be solved
This chapter will show you ...

- how to interpret distance-time and velocity-time graphs
- how to interpret other types of graph associated with real-life situations

Visual overview

What you should already know

- How to plot coordinate points
- How to read scales

Quick check

1 Give the coordinates of points A, B and C.

2 What are the values shown on the following scales?

   a
   b
Sometimes when using distance–time graphs, you will need to change the given units of speed.

**EXAMPLE 1**

Change 15 metres per second to kilometres per hour.

\[
15 \text{ m/s} = 15 \times 60 \times 60 \text{ metres per hour} = 54,000 \text{ m/h} \\
54,000 \text{ m/h} = 54,000 \div 1000 \text{ km/h} = 54 \text{ km/h}
\]

**EXAMPLE 2**

Change 24 kilometres per hour to metres per minute.

\[
24 \text{ km/h} = 24 \times 1000 \text{ m/h} = 24,000 \text{ m/h} \\
24,000 \text{ m/h} = 24,000 \div 60 \text{ m/min} = 400 \text{ m/min}
\]

**EXERCISE 13A**

Paul was travelling in his car to a meeting. He set off from home at 7:00 am, and stopped on the way for a break. This distance–time graph illustrates his journey.

- **a** At what time did he:
  - i stop for his break?
  - ii set off after his break?
  - iii get to his meeting place?

- **b** At what average speed was he travelling:
  - i over the first hour?
  - ii over the second hour?
  - iii for the last part of his journey?
James was travelling to Cornwall on his holidays. This distance–time graph illustrates his journey.

a His fastest speed was on the motorway.
   i How much motorway did he use?
   ii What was his average speed on the motorway?

b i When did he travel the slowest?
   ii What was his slowest average speed?

Richard and Paul had a 5000 m race. The distance covered is illustrated below.

a Paul ran a steady race. What is his average speed in:
   i metres per minute?
   ii km/h?

b Richard ran in spurts. What was his quickest average speed?

c Who won the race and by how much?

Three friends, Patrick, Araf and Sean, ran a 1000 metres race. The race is illustrated on the distance–time graph below.

a Describe the race of each friend.

b i What is the average speed of Araf in m/s?
   ii What is this speed in km/h?
Gradient of straight-line distance–time graphs

The gradient of a straight line is a measure of its slope.

The gradient of this line can be found by constructing a right-angled triangle whose hypotenuse (sloping side) is on the line. Then:

\[
\text{Gradient} = \frac{\text{Distance measured vertically}}{\text{Distance measured horizontally}} = \frac{6}{4} = 1.5
\]

Look at the following examples of straight lines and their gradients.

Note: Lines which slope downwards from left to right have negative gradients.

In the case of a straight-line graph between two quantities, its gradient is found using the scales on its axes, not the actual number of grid squares. The gradient usually represents a third quantity whose value we want to know. For example, look at the next graph.

The gradient on this distance–time graph represents average speed.

\[
\text{Gradient} = \frac{500 \text{ km}}{2 \text{ h}} = 250 \text{ km/h}
\]
Calculate the gradient of each line, using the scales on the axes.

Calculate the average speed of the journey represented by each line in the following diagrams.

From each diagram below, calculate the speed between each stage of each journey.
In our calculations of speed, we have ignored the sign of the gradient. The sign of the gradient of a distance–time graph gives the direction of travel. Once we introduce the direction of travel into our calculations, then we must use the term velocity instead of speed.

Velocity at time \( t \) is the gradient of the distance–time graph at \( t \), including its sign.

When the velocity of a moving object is plotted against time, the gradient of the velocity–time graph at any time \( t \) is equal to the acceleration of the object at that time.

Acceleration is rate of change of velocity, so when the gradient becomes negative, the object is slowing down. Negative acceleration is called deceleration.

The units of acceleration and deceleration are m/s\(^2\) or m s\(^{-2}\), and km/h\(^2\) or km h\(^{-2}\).

**EXAMPLE 3**

Below is the velocity–time graph of a particle over a 6-second period, drawn from measurements made during a scientific experiment. Describe what is happening at each stage of the 6 seconds.

The graph shows a constant particle velocity of 10 m/s for the first 2 seconds (AB). Then the velocity increases uniformly from 10 m/s to 20 m/s over 1 second (BC). Then follows another period of constant velocity (20 m/s) over 1 second (CD), after which the velocity increases uniformly from 20 m/s to 30 m/s in 0.5 seconds (DE). During the final 1.5 seconds the velocity is constant at 30 m/s.

There are two periods of acceleration: BC and DE.

\[
\text{Acceleration over } BC = \text{gradient of } BC = \frac{10 \text{ m/s}}{1 \text{ s}} = 10 \text{ m/s}^2
\]

\[
\text{Acceleration over } DE = \text{gradient of } DE = \frac{10 \text{ m/s}}{0.5 \text{ s}} = 20 \text{ m/s}^2
\]
The diagram shows the velocity of a model car over 6 seconds.

Calculate the acceleration:

a. over the first second
b. after 5 seconds.

The diagram shows the velocity–time graph for a short tram journey between stops.

Find:

a. the acceleration over the first 10 seconds
b. the deceleration over the last 10 seconds.

The diagram shows the velocity of a boat over an 18-hour period.

Calculate:

a. the times at which the boat was travelling at a constant velocity
b. the acceleration during each part of the journey.

An aircraft flying at a constant height of 300 m dropped a load fitted to a parachute. During the times stated, the velocity of the parachute was as follows:

<table>
<thead>
<tr>
<th>Time (seconds)</th>
<th>Velocity (m/s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–2</td>
<td>0–20</td>
</tr>
<tr>
<td>2–6</td>
<td>20–2</td>
</tr>
<tr>
<td>After 6</td>
<td>2</td>
</tr>
</tbody>
</table>

Draw a velocity–time graph for the first 8 seconds.

Starting from rest (zero velocity), a particle travels as indicated below.

- Accelerates at a constant rate over 5 seconds to reach 15 m/s.
- Keeps this velocity for 10 seconds.
- Accelerates over the next 5 seconds to reach 25 m/s.
- Steadily slows down to reach rest (zero velocity) over the next 10 seconds.

a. Draw the velocity–time graph.
b. Calculate the acceleration over the first 5 seconds.
Some situations can lead to unusual graphs. For example, this graph represents the cost of postage of a first-class letter against its weight.

This next graph shows the change in the depth of water in a flat-bottomed flask, as it is filled from a tap delivering water at a steady rate. The graph shows that at first the depth of water increases quickly then slows down as the flask gets wider. As the flask gets narrower, the depth increases at a faster rate. Finally, when the water reaches the neck, which has a constant cross-section, the depth increases at a constant rate to the top of the neck.

The application of graphs to describe the rate of change of depth as a container is filled with water is also covered in question 1 (Exercise 13D).

Two other examples of the use of graphs are set-out in Exercise 13D. They are the calculation of personal income tax (question 2) and the calculation of mortgage repayments (question 3).

Further practical applications of graphs, with special reference to finding the formulae or rules governing them, are featured on pages 375.

EXERCISE 13D

Draw a graph of the depth of water in each of these containers as it is filled steadily.
The following is a simplified model of how income tax is calculated for an individual.

The first £4000 earned is tax free. Any income over £4000 up to £30 000 is taxed at 25%. For example, a person who earns £10 000 per year would pay 25% of £6000 = £1500. Any income over £30 000 is taxed at 40%.

a  Draw a graph to show the amount of tax paid by people who earn up to £40 000 per year.
   (Take the horizontal axis as “Income” from £0 to £40 000. Take the vertical axis as “Tax paid” from £0 to £11 000.)

b  For people who earn up to £40 000 per year, draw a graph of the percentage of income paid as tax against income.
   (Take the horizontal axis as “Income” from £0 to £40 000. Take the vertical axis as “Percentage of income paid as tax” from 0% to 30%.)

In a repayment mortgage, a fixed amount is paid per month for a long period (usually 15 to 25 years). At first, most of the money is used to pay off the interest and only a small amount is paid off the sum borrowed. Over time, the amount due to interest reduces and more money is used to pay off the sum borrowed. The following is a simple model for a loan of £50 000 (the capital) borrowed over 15 years at a fixed annual rate of interest of 5%. The monthly amount to be paid is £400.

a  Copy and complete the following calculations to show that it takes approximately 15 years to pay off the money borrowed plus interest.

   Amount owing at end of year 1 = 50 000 + 5% = 52 500
   Repayments over year 1 = 12 \times 400 = 4 800
   Total owed at end of year 1 = 47 700
   Amount owing at end of year 2 = 47 700 + 5% = 50 085
   Repayments over year 2 = 12 \times 400 = 4 800
   Total owed at end of year 2 = 45 285
   Amount owing at end of year 3 = 45 285 + 5% = .......... 
   Repayments over year 3 = 12 \times 400 = 4 800
   Total owed at end of year 3 = .......... 
   and so on

b  Draw a graph of “Amount owing (£)” against “Time (years)”. 
   (Take the horizontal axis as “Time” from 0 to 15 years. Take the vertical axis as “Amount owing” from £0 to £50 000.)
   Plot the first point as (0, 50 000), The second as (1, 47 700), and so on.
P, Q and R are three stations on a railway line.

\[ \text{PQ} = 26 \text{ miles.} \]
\[ \text{QR} = 4 \text{ miles.} \]

A passenger train leaves P at 12.00. It arrives at Q at 12.30.

Information about the journey from P to Q is shown on the travel graph below.

The passenger train stops at Q for 10 minutes.

It then returns to P at the same speed as on the journey from P to Q.

a. On a copy of the grid, complete the travel graph for this train.

A goods train leaves R at 12.00.
It arrives at P at 13.00.

b. On a copy of the grid, draw the travel graph for the goods train.

c. Write down the distance from P where the goods train passes the passenger train.

---

A man left home at 12 noon to go for a cycle ride.

The travel graph represents part of the man’s journey.

At 12.45 pm the man stopped for a rest.

a. For how many minutes did he rest?

b. Find his distance from home at 1.30 pm.

The man stopped for another rest at 2 pm.
He rested for one hour.
Then he cycled home at a steady speed. It took him 2 hours.

c. Copy and complete the travel graph.

Edexcel, Question 8, Paper 4 Intermediate, June 2005

---

A train travels from Scotland to London in 4 \( \frac{1}{2} \) hours.
The distance traveled is 289 miles. Find the average speed of the train in miles per hour.

Cheryl drives a car 453 km from Cornwall to Scotland, using 30 litres of petrol.
396 km are on the motorway and 57 kilometres on normal roads.
On normal roads the car averages 9.5 km to a litre of petrol.
How many km per litre does the car average on the motorways?

Daniel leaves his house at 07.00.
He drives 87 miles to work.
He drives at an average speed of 36 miles per hour.
At what time does Daniel arrive at work?

Edexcel, Question 16, Paper 4 Intermediate, November 2003
A pool takes 5 hours to fill. For the first $\frac{1}{2}$ hours the pool is filled at the rate of 60,000 litres per hour. For the next 2 hours the pool is filled at the rate of 70,000 litres per hour. For the last $\frac{1}{2}$ hours the pool is filled at 80,000 litres per hour.

a. Show this information on a graph with a horizontal axis showing time from 0 to 6 hours and a vertical axis showing litres from 0 to 400,000.

b. The pool takes 7 hours to empty at a steady rate. What is the average rate of flow when the pool is emptying?

Charlotte cycles up a country lane, setting off from home at 9 am. She cycles for 30 km at a steady speed of 20 km/hour. She stops at that point for a 30 minute rest, then sets off back home again, arriving at 11:45 am.

a. Show this information on a travel graph with a horizontal axis showing time from 9 am to 12 pm and a vertical axis showing distance from home from 0 to 40 km.

b. Calculate the average speed of the return journey in km per hour.
GRADE YOURSELF

- Able to draw and read information from a distance–time graph
- Able to calculate the gradient of a straight line and use this to find speed from a distance–time graph
- Able to interpret real-life graphs
- Able to interpret and draw more complex real-life graphs

What you should know now

- How to find the speed from a distance–time graph
- How to interpret real-life graphs
This chapter will show you ...

- what similar triangles are
- how to work out the scale factor between similar figures
- how to use the scale factor to work out lengths in similar figures
- how to use the scale factor to work out areas and volumes of similar shapes

What you should already know

- The meaning of congruency
- How to calculate a ratio and cancel it down
- The square and cubes of integers
- How to solve equations of the form \( \frac{x}{y} = \frac{2}{3} \)

Quick check  → ANSWERS

1 Which of the following triangles is congruent to this triangle.

\[ \begin{align*}
\text{a} & \quad \text{b} & \quad \text{c} & \quad \text{d} & \quad \text{e}
\end{align*} \]

2 Solve the equations.

\[ \begin{align*}
\text{a} & \quad \frac{x}{12} = \frac{7}{3} \\
\text{b} & \quad \frac{x}{10} = \frac{21}{15}
\end{align*} \]
14.1 Similar triangles

In this section you will learn how to:
- show two triangles are similar
- work out the scale factor between similar triangles

Key word similar

Triangles are similar if their corresponding angles are equal. Their corresponding sides are then in the same ratio.

**EXAMPLE 1**

The triangles ABC and PQR are similar. Find the length of the side PR.

Take two pairs of corresponding sides, one pair of which must contain the unknown side. Form each pair into a fraction, so that $x$ is on top. Since these fractions must be equal

\[
\frac{PR}{AC} = \frac{PQ}{AB}
\]

\[
x = \frac{9}{6}
\]

To find $x$.

\[
x = \frac{9 \times 8}{6} \text{ cm} \Rightarrow x = \frac{72}{6} = 12 \text{ cm}
\]

**EXERCISE 14A**

These diagrams are drawn to scale. What is the scale factor of the enlargement in each case?

If you need to revise scale of enlargement, look back at Section 8.5.
Are these pairs of shapes similar? If so, give the scale factor. If not, give a reason.

a  
3 cm  
5 cm  
20 cm

b

12 cm

15 cm

Explain why these shapes are similar.

b Give the ratio of the sides.

c Which angle corresponds to angle C?

d Which side corresponds to side QP?

Explain why these shapes are similar.

b Which angle corresponds to angle A?

c Which side corresponds to side AC?

Explain why triangle ABC is similar to triangle AQR.

b Which angle corresponds to the angle at B?

c Which side of triangle AQR corresponds to side AC of triangle ABC?

Your answers to question 4 may help you.

In the diagrams a to f, each pair of shapes are similar but not drawn to scale. Find the lengths of the sides as requested.

a Find x.

b Find PQ.

c Find x and y.

d Find x and y.
Special cases of similar triangles

**EXAMPLE 2**

Find the sides marked \(x\) and \(y\) in these triangles (not drawn to scale).

Triangles \(AED\) and \(ABC\) are similar. So using the corresponding sides \(CB, DE\) with \(AC, AD\) gives

\[
\frac{x}{5} = \frac{10}{4} \quad \Rightarrow \quad x = \frac{10 \times 5}{4} = 12.5
\]

Using the corresponding sides \(AE, AB\) with \(AD, AC\) gives

\[
\frac{y + 6}{6} = \frac{10}{4} \quad \Rightarrow \quad y + 6 = \frac{10 \times 6}{4} = 15 \quad \Rightarrow \quad y = 15 - 6 = 9
\]
EXAMPLE 3

Ahmed wants to work out the height of a tall building. He walks 100 paces from the building and sticks a pole, 2 metres long, vertically into the ground. He then walks another 10 paces on the same line and notices that when he looks from ground level, the top of the pole and the top of the building are in line. How tall is the building?

First, draw a diagram of the situation and label it.

Using corresponding sides ED, CB with AD, AB gives

\[
\frac{x}{2} = \frac{110}{10}
\]

\[
\Rightarrow x = \frac{110 \times 2}{10} = 22 \text{ m}
\]

Hence the building is 22 metres high.

EXERCISE 14B

In each of the cases below, state a pair of similar triangles and find the length marked x. Separate the similar triangles if it makes it easier for you.

a

b

In the diagrams a to e, find the lengths of the sides as requested.
This diagram shows a method of working out the height of a tower.

A stick, 2 metres long, is placed vertically 120 metres from the base of a tower so that the top of the tower and the top of the stick is in line with a point on the ground 3 metres from the base of the stick. How high is the tower?

It is known that a factory chimney is 330 feet high. Patrick paces out distances as shown in the diagram, so that the top of the chimney and the top of the flag pole are in line with each other. How high is the flag pole?

The shadow of a tree and the shadow of a golf flag coincide, as shown in the diagram. How high is the tree?

Find the height of a pole which casts a shadow of 1.5 metres when at the same time a man of height 165 cm casts a shadow of 75 cm.

Andrew, who is about 120 cm tall, notices that when he stands at the bottom of his garden, which is 20 metres away from his house, his dad, who is about 180 cm tall, looks as big as the house when he is about 2.5 metres away from Andrew. How high is the house?
More complicated problems

The information given in a similar triangle situation can be more complicated than anything you have so far met, and you will need to have good algebraic skills to deal with it. Example 4 is typical of the more complicated problem you may be asked to solve, so follow it through carefully.

**EXAMPLE 4**

Find the value of \( x \) in this triangle.

You know that triangle ABC is similar to triangle ADE.

Splitting up the triangles may help you to see what will be needed.

So your equation will be

\[
\frac{x + 15}{x} = \frac{30}{20}
\]

Cross multiplying (moving each of the two bottom terms to the opposite side and multiplying) gives

\[
20x + 300 = 30x
\]

\[
\Rightarrow 300 = 10x \Rightarrow x = 30 \text{ cm}
\]

**EXERCISE 14C**

Find the lengths \( x \) or \( x \) and \( y \) in the diagrams 1 to 6.
Areas and volumes of similar shapes

This section will show you how to:
- do problems involving the area and volume of similar shapes

Key words
- area ratio
- area scale factor
- length ratio
- linear scale factor
- volume ratio
- volume scale factor

There are relationships between the lengths, areas and volumes of similar shapes.

You saw on pages 182–184 that when a plane shape is enlarged by a given scale factor to form a new, similar shape, the corresponding lengths of the original shape and the new shape are all in the same ratio, which is equal to the scale factor. This scale factor of the lengths is called the length ratio or linear scale factor.

Two similar shapes also have an area ratio, which is equal to the ratio of the squares of their corresponding lengths. The area ratio, or area scale factor, is the square of the length ratio.

Likewise, two 3-D shapes are similar if their corresponding lengths are in the same ratio. Their volume ratio is equal to the ratio of the cubes of their corresponding lengths. The volume ratio, or volume scale factor, is the cube of the length ratio.

Generally, the relationship between similar shapes can be expressed as

Length ratio $x : y$
Area ratio $x^2 : y^2$
Volume ratio $x^3 : y^3$

EXAMPLE 5

A model yacht is made to a scale of $\frac{1}{20}$ of the size of the real yacht. The area of the sail of the model is 150 cm$^2$. What is the area of the sail of the real yacht?

At first sight, it may appear that you do not have enough information to solve this problem, but it can be done as follows.

Linear scale factor = 1 : 20
Area scale factor = 1 : 400 (square of the linear scale factor)
Area of real sail = 400 x area of model sail
= 400 x 150 cm$^2$
= 60 000 cm$^2$ = 6 m$^2$
EXAMPLE 6

A bottle has a base radius of 4 cm, a height of 15 cm and a capacity of 650 cm$^3$. A similar bottle has a base radius of 3 cm.

a. What is the length ratio?
b. What is the volume ratio?
c. What is the volume of the smaller bottle?

a. The length ratio is given by the ratio of the two radii, that is 4 : 3.
b. The volume ratio is therefore $4^3 : 3^3 = 64 : 27$.
c. Let $v$ be the volume of the smaller bottle. Then the volume ratio is

\[
\frac{\text{Volume of smaller bottle}}{\text{Volume of larger bottle}} = \frac{v}{650} = \frac{27}{64}
\]

\[\Rightarrow v = \frac{27 \times 650}{64} = 274 \text{ cm}^3 \text{ (3 significant figures)}\]

EXAMPLE 7

The cost of a paint can, height 20 cm, is £2.00 and its label has an area of 24 cm$^2$.

a. If the cost is based on the amount of paint in the can, what is the cost of a similar can, 30 cm high?
b. Assuming the labels are similar, what will be the area of the label on the larger can?

a. The cost of the paint is proportional to the volume of the can.

Length ratio = 20 : 30 = 2 : 3
Volume ratio = $2^3 : 3^3 = 8 : 27$

Let $P$ be the cost of the larger can. Then the cost ratio is

\[
\frac{\text{Cost of larger can}}{\text{Cost of smaller can}} = \frac{P}{\frac{2}{8}}
\]

Therefore,

\[P = \frac{27}{8} \times \frac{2}{8} = £6.75\]

b. Area ratio = $2^2 : 3^2 = 4 : 9$

Let $A$ be the area of the larger label. Then the area ratio is

\[
\frac{\text{Larger label area}}{\text{Smaller label area}} = \frac{A}{24}
\]

Therefore,

\[A = \frac{9 \times 24}{4} = 54 \text{ cm}^2\]
The length ratio between two similar solids is 2 : 5.

a. What is the area ratio between the solids?

b. What is the volume ratio between the solids?

The length ratio between two similar solids is 4 : 7.

a. What is the area ratio between the solids?

b. What is the volume ratio between the solids?

Copy and complete this table.

Some years ago, a famous beer advertisement showed a bar attendant taking an ordinary pint glass and filling it with beer underneath the counter. When the glass reappeared, it was full of beer and its width and height were twice those of the original glass. The slogan on the advertisement was “The pint that thinks it’s a quart”. (A quart is 2 pints.)

a. What was the length ratio of the two glasses used in the advertisement?

b. What was the volume ratio of the two glasses?

c. The smaller glass held a pint. How much would the larger glass have held?

d. Is the advertisement fair?

A shape has an area of 15 cm$^2$. What is the area of a similar shape whose lengths are three times the corresponding lengths of the first shape?

A toy brick has a surface area of 14 cm$^2$. What would be the surface area of a similar toy brick whose lengths are?

a. twice the corresponding lengths of the first brick?

b. three times the corresponding lengths of the first brick?

A sheepskin rug covers 12 ft$^2$ of floor. What area would be covered by rugs with these lengths?

a. twice the corresponding lengths of the first rug

b. half the corresponding lengths of the first rug
8 A brick has a volume of 300 cm$^3$. What would be the volume of a similar brick whose lengths are
   a twice the corresponding lengths of the first brick?
   b three times the corresponding lengths of the first brick?

9 Thirty cubic centimetres of clay were used to make a model sheep. What volume of clay would be
   needed to make a similar model sheep with these lengths?
   a five times the corresponding lengths of the first model
   b one half of the corresponding lengths of the first model

10 A can of paint, 6 cm high, holds a half a litre of paint. How much paint would go into a similar can
    which is 12 cm high?

11 It takes 1 litre of paint to fill a can of height 10 cm. How much paint does it take to fill a similar can
    of height 45 cm?

12 It takes 1.5 litres of paint to fill a can of height 12 cm.
   a How much paint does it take to fill a similar can whose dimensions are 1$\frac{1}{2}$ times the
      corresponding dimensions of the first can?
   b Which of the information given is not needed to be able to answer part a?

13 To make a certain dress, it took 2.4 m$^2$ of material. How much material would a similar dress need
    if its lengths were
   a 1.5 times the corresponding lengths of the first dress?
   b three quarters of the corresponding lengths of the first dress?

14 A model statue is 10 cm high and has a volume of 100 cm$^3$. The real statue is 2.4 m high. What is
    the volume of the real statue? Give your answer in m$^3$.

15 A small can of paint costs 75p. What is the cost of a larger similar can whose circumference is twice
    that of the smaller can? Assume that the cost is based only on the volume of paint in the can.

16 A triangle has sides of 3, 4 and 5 cm. Its area is 6 cm$^2$. How long are the sides of a similar triangle
    that has an area of 24 cm$^2$?

17 A ball with a radius of $r$ cm has a volume of 10 cm$^3$. What is the radius of a ball with a volume of
    270 cm$^3$?
Calculate the area of each of the shaded faces and hence calculate the volume of each of these solids. (They are not drawn to scale.)

Which two solids are similar?

Using area and volume ratios

In some problems involving similar shapes, the length ratio is not given, so we have to start with the area ratio or the volume ratio. We usually then need first to find the length ratio in order to proceed with the solution.

Example 8

A manufacturer makes a range of clown hats that are all similar in shape. The smallest hat is 8 cm tall and uses 180 cm\(^2\) of card. What will be the height of a hat made from 300 cm\(^2\) of card?

The area ratio is 180 : 300

Therefore, the length ratio is \(\sqrt{180} : \sqrt{300}\) (do not calculate these yet)

Let the height of the larger hat be \(H\), then

\[
\frac{H}{8} = \frac{\sqrt{300}}{\sqrt{180}} = \sqrt{\frac{300}{180}}
\]

\[
\Rightarrow H = 8 \times \sqrt{\frac{300}{180}} = 10.3\ \text{cm (1 decimal place)}
\]
EXAMPLE 9

A supermarket stocks similar small and large cans of soup. The areas of their labels are 110 cm² and 190 cm² respectively. The weight of a small can is 450 g. What is the weight of a large can?

The area ratio is 110 : 190

Therefore, the length ratio is \( \sqrt[3]{110} : \sqrt[3]{190} \) (do not calculate these yet)

So the volume (weight) ratio is \( (\sqrt[3]{110})^3 : (\sqrt[3]{190})^3 \).

Let the weight of a large can be \( W \), then

\[
\frac{W}{450} = \left( \frac{\sqrt[3]{190}}{\sqrt[3]{110}} \right)^3 = \left( \frac{\sqrt[3]{190}}{\sqrt[3]{110}} \right)^3
\]

\[
\Rightarrow W = 450 \times \left( \frac{\sqrt[3]{190}}{\sqrt[3]{110}} \right)^3 = 1020 \text{ g} \quad (3 \text{ significant figures})
\]

EXAMPLE 10

Two similar cans hold respectively 1.5 litres and 2.5 litres of paint. The area of the label on the smaller can is 85 cm². What is the area of the label on the larger can?

The volume ratio is 1.5 : 2.5

Therefore, the length ratio is \( \sqrt[3]{1.5} : \sqrt[3]{2.5} \) (do not calculate these yet)

So the area ratio is \( (\sqrt[3]{1.5})^2 : (\sqrt[3]{2.5})^2 \)

Let the area of the label on the larger can be \( A \), then

\[
\frac{A}{85} = \left( \frac{\sqrt[3]{2.5}}{\sqrt[3]{1.5}} \right)^2 = \left( \frac{\sqrt[3]{2.5}}{\sqrt[3]{1.5}} \right)^2
\]

\[
\Rightarrow A = 85 \times \left( \frac{\sqrt[3]{2.5}}{\sqrt[3]{1.5}} \right)^2 = 119 \text{ cm}^2 \quad (3 \text{ significant figures})
\]

EXERCISE 14E

1 A firm produces three sizes of similarly shaped labels for its products. Their areas are 150 cm², 250 cm² and 400 cm². The 250 cm² label just fits around a can of height 8 cm. Find the heights of similar cans around which the other two labels would just fit.

2 A firm makes similar gift boxes in three different sizes: small, medium and large. The areas of their lids are as follows.

small: 30 cm², medium: 50 cm², large: 75 cm²

The medium box is 5.5 cm high. Find the heights of the other two sizes.
A cone, height 8 cm, can be made from a piece of card with an area of 140 cm\(^2\). What is the height of a similar cone made from a similar piece of card with an area of 200 cm\(^2\)?

It takes 5.6 litres of paint to paint a chimney which is 3 m high. What is the tallest similar chimney that can be painted with 8 litres of paint?

A man takes 45 minutes to mow a lawn 25 m long. How long would it take him to mow a similar lawn only 15 m long?

A piece of card, 1200 cm\(^2\) in area, will make a tube 13 cm long. What is the length of a similar tube made from a similar piece of card with an area of 500 cm\(^2\)?

All television screens (of the same style) are similar. If a screen of area 220 cm\(^2\) has a diagonal length of 21 cm, what will be the diagonal length of a screen of area 350 cm\(^2\)?

Two similar statues, made from the same bronze, are placed in a school. One weighs 300 g, the other weighs 2 kg. The height of the smaller statue is 9 cm. What is the height of the larger statue?

A supermarket sells similar cans of pasta rings in three different sizes: small, medium and large. The sizes of the labels around the cans are as follows.

- small can: 24 cm\(^2\)
- medium can: 46 cm\(^2\)
- large can: 78 cm\(^2\)

The medium size can is 6 cm tall with a weight of 380 g. Calculate these quantities.

a. the heights of the other two sizes

b. the weights of the other two sizes

Two similar bottles are 20 cm and 14 cm high. The smaller bottle holds 850 ml. Find the capacity of the larger one.

A statue weighs 840 kg. A similar statue was made out of the same material but two fifths the height of the first one. What was the weight of the smaller statue?

A model stands on a base of area 12 cm\(^2\). A smaller but similar model, made of the same material, stands on a base of area 7.5 cm\(^2\). Calculate the weight of the smaller model if the larger one is 3.5 kg.

A solid silver statue was melted down to make 100,000 similar miniatures, each 2 cm high. How tall was the original statue?

Two similar models have volumes 12 m\(^3\) and 30 m\(^3\). If the surface area of one of them is 2.4 m\(^2\), what are the possible surface areas of the other model?
Two rectangles have the dimensions shown.

Are the rectangles similar? Explain your answer clearly.

Triangle ABC is similar to triangle CDE.
Calculate the length of CD.

In the triangle PQR, AB is parallel to QR. AB = 10 cm, QR = 16 cm and BR = 12 cm. Find the length PB.

PQR and PXY are similar triangles. Calculate the length of RY.

X and Y are two geometrically similar solid shapes. The total surface area of shape X is 450 cm². The total surface area of shape Y is 800 cm². The volume of shape X is 1350 cm³. Calculate the volume of shape Y.

Edexcel, Question 17, Paper 6 Higher, November 2004

Two cylinders, P and Q, are mathematically similar. The total surface area of cylinder P is 90π cm². The total surface area of cylinder Q is 810π cm². The length of cylinder P is 4 cm.

a Work out the length of cylinder Q.
The volume of cylinder P is 100π cm³.
b Work out the volume of cylinder Q. Give your answer as a multiple of π.

Edexcel, Question 18, Paper 5 Higher, June 2005

WORKED EXAM QUESTION

A camping gas container is in the shape of a cylinder with a hemispherical top. The dimensions of the container are shown in the diagram.

It is decided to increase the volume of the container by 20%. The new container is mathematically similar to the old one.

Calculate the base diameter of the new container.

Solution

Old Volume : New volume = 100% : 120% = 1 : 1.2

\[ \sqrt[3]{1 : 1.2} = 1 : 1.06265 \]

New diameter = Old diameter \( \times \) 1.06265 = 8 \( \times \) 1.06265 = 8.5 cm

First find the volume scale factor.
Take the cube root to get the linear scale factor.
Multiply the old diameter by the linear scale factor to get the new diameter.

Martin works for a light company called “Bright Ideas”. He has been asked to calculate accurate measurements for a new table lamp the company are going to produce. The three main components are the base, the stem and the shade. Below is a sketch of the side view, and an “exploded” diagram which shows the lamp in more detail.

The base and stem are made from a material which has a density of 10 g/cm³. Help Martin complete the table to find the total weight of the stem and the base.

<table>
<thead>
<tr>
<th>volume of stem</th>
<th>cm³</th>

</tbody>
</table>
Martin knows a cone is made from the sector of a circle, but he needs to calculate the angle of the sector $\theta$.

He draws this diagram of the large cone to help.

Find the angle $\theta$ for Martin.

A material trim is to go around the bottom and top circles of the lampshade.

Help Martin use this diagram to calculate the total length of trim needed.

Draw an accurate scale drawing for Martin of the side view of the lamp using a scale of $3 : 1$. 

GRADE YOURSELF

- Know why two shapes are similar
- Able to work out unknown sides using scale factors and ratios
- Able to set up equations to find missing sides in similar triangles
- Able to solve problems using area and volume scale factors
- Able to solve practical problems using similar triangles
- Able to solve related problems involving, for example, capacity, using area and volume scale factors

What you should know now

- How to find the ratios between two similar shapes
- How to work out unknown lengths, areas and volumes of similar 3-D shapes
- How to solve practical problems using similar shapes
- How to solve problems using area and volume ratios

This chapter will show you ...

- how to use trigonometric relationships to solve more complex 2-D problems and 3-D problems
- how to use the sine and cosine rules to solve problems involving non right-angled triangles
- how to find the area of a triangle using the rule $\text{Area} = \frac{1}{2}ab \sin C$

What you should already know

- How to find the sides of right-angled triangles using Pythagoras’ theorem
- How to find angles and sides of right-angled triangles using sine, cosine and tangent

Quick check

1. Find the side $x$ in this triangle.

2. Find the angle $x$ in this triangle.
15.1 Some 2-D problems

In this section you will learn how to:
- use trigonometric ratios and Pythagoras' theorem to solve more complex two-dimensional problems

Key words
- area
- length
- perpendicular

EXAMPLE 1

In triangle ABC, AB = 6 cm, BC = 9 cm and angle ABC = 52°.
Calculate the following.

a the length of the perpendicular from A to BC
b the area of the triangle

\[ a \]
Drop the perpendicular from A to BC to form
the right-angled triangle ADB.

Let \( h \) be the length of the perpendicular AD. Then
\[ h = 6 \sin 52° = 4.73 \text{ (3 significant figures)} \]

\[ b \]
The area of triangle ABC is given by
\[ \text{Area} = \frac{1}{2} \times \text{base} \times \text{height} \]
\[ = \frac{1}{2} \times 9 \times h = 21.3 \text{ cm}^2 \text{ (3 significant figures)} \]

EXAMPLE 2

SR is a diameter of a circle whose radius is 25 cm.
PQ is a chord at right angles to SR. X is the midpoint of PQ.
The length of XR is 1 cm. Calculate the length of the arc PQ.

To find the length of the arc PQ, you need first to find the angle it subtends at the centre of the circle. (See page 157.)

So join P to the centre of the circle O to obtain the angle POX, which is equal to half the angle subtended by PQ at O.

In right-angled triangle POX
\[ OX = OR - XR \]
\[ OX = 25 - 1 = 24 \text{ cm} \]

Therefore,
\[ \cos x = \frac{24}{25} \]
\[ \Rightarrow x = \cos^{-1} 0.96 = 16.26° \]

So, the angle subtended at the centre by the arc PQ is \( 2 \times 16.26° = 32.52° \), giving the length of the arc PQ as
\[ \frac{32.52°}{360°} \times 2 \times \pi \times 25 = 14.2 \text{ cm} \text{ (3 significant figures)} \]
AC and BC are tangents to a circle of radius 7 cm. Calculate the length of AB.

CD, length 20 cm, is a diameter of a circle. AB, length 12 cm, is a chord at right angles to DC. Calculate the angle AOB.

Calculate the length of AB.

A building has a ledge halfway up, as shown in the diagram. Alf measures the length AB as 100 m, the angle CAB as 31° and the angle EAB as 42°. Use this information to calculate the width of the ledge CD.

AB and CD are two equal, perpendicular chords of a circle that intersect at X. The circle is of radius 6 cm and the angle COA is 113°. Calculate these.

a the length AC
b the angle XAO
c the length XB

A vertical flagpole PQ is held by a wooden framework, as shown in the diagram. The framework is in the same vertical plane. Angle SRP = 25°, SQ = 6 m and PR = 4 m. Calculate the size of the angle QRP.
Solving a problem set in three dimensions nearly always involves identifying a right-angled triangle that contains the length or angle required. This triangle will have to contain (apart from the right angle) two known measures from which the required calculation can be made.

It is essential to extract the triangle you are going to use from its 3-D situation and redraw it as a separate, plain, right-angled triangle. (It is rarely the case that the required triangle appears as a true right-angled triangle in its 3-D representation. Even if it does, it should still be redrawn as a separate figure.)

The redrawn triangle should be annotated with the known quantities and the unknown quantity to be found.

Always write down working values to at least 4 significant figures, to avoid inaccuracy in the final answer.
EXAMPLE 4

The diagram shows a cuboid 22.5 cm by 40 cm by 30 cm. M is the midpoint of FG.

Calculate these angles.

a. ABE
b. ECA
c. EMH

\[ a \] The right-angled triangle containing the angle required is ABE.

Solving for \( \alpha \) gives

\[ \tan \alpha = \frac{40}{22.5} = 1.7777 \]

\[ \Rightarrow \alpha = \tan^{-1} 1.7777 = 60.6^\circ \text{ (3 significant figures)} \]

\[ b \] The right-angled triangle containing the angle required is ACE, but for which only AE is known. Therefore, you need to find AC by applying Pythagoras to the right-angled triangle ABC.

\[ x^2 = (22.5)^2 + (30)^2 \text{ cm}^2 \]

\[ \Rightarrow x = 37.5 \text{ cm} \]

Returning to triangle ACE, you obtain

\[ \tan \beta = \frac{40}{37.5} = 1.0666 \]

\[ \Rightarrow \beta = 46.8^\circ \text{ (3 significant figures)} \]

\[ c \] EMH is an isosceles triangle.

Drop the perpendicular from M to N, the midpoint of HE, to form two right-angled triangles. Angle HMN equals angle EMN, and HN = NE = 15 cm.

Taking triangle MEN, you obtain

\[ \tan \theta = \frac{15}{22.5} = 0.66666 \]

\[ \Rightarrow \theta = \tan^{-1} 0.66666 = 33.7^\circ \]

Therefore, angle HME is \( 2 \times 33.7^\circ = 67.4^\circ \) (3 significant figures)
**EXERCISE 15B**

1. The diagram shows a pyramid. The base is a horizontal rectangle ABCD, 20 cm by 15 cm. The length of each sloping edge is 24 cm. The apex, V, is over the centre of the rectangular base. Calculate these.
   - (a) the size of the angle VAC
   - (b) the height of the pyramid
   - (c) the volume of the pyramid
   - (d) the size of the angle between the face VAD and the base ABCD

2. The diagram shows the roof of a building. The base ABCD is a horizontal rectangle 7 m by 4 m. The triangular ends are equilateral triangles. Each side of the roof is an isosceles trapezium. The length of the top of the roof, EF, is 5 m. Calculate these.
   - (a) the length EM, where M is the midpoint of AB
   - (b) the size of angle EBC
   - (c) the size of the angle between the face EAB and the base ABCD
   - (d) the surface area of the roof (excluding the base)

3. ABCD is a vertical rectangular plane. EDC is a horizontal triangular plane. Angle CDE = 90°, AB = 10 cm, BC = 4 cm and ED = 9 cm. Calculate these.
   - (a) angle AED
   - (b) angle DEC
   - (c) EC
   - (d) angle BEC

4. The diagram shows a tetrahedron. The base ABC is a horizontal equilateral triangle of side 8 cm. The vertex D is 5 cm directly above the point B. Calculate these angles.
   - (a) DCB
   - (b) the angle between the face ADC and the face ABC

5. The diagram shows a tetrahedron, each face of which is an equilateral triangle of side 6 m. The lines AN and BM meet the sides CB and AC at a right angle. The lines AN and BM intersect at X, which is directly below the vertex, D. Calculate these.
   - (a) the distance AX
   - (b) the angle between the side DBC and the base ABC
15.3 Trigonometric ratios of angles between 90° and 360°

This section will show you how to:

- find the sine, cosine and tangent of any angle from 0° to 360°

Key words

- cosine
- sine
- tangent

You should have discovered these three facts.

- When 90° < x < 180°, sin x = sin (180° – x)
  
  For example, sin 153° = sin (180° – 153°) = sin 27° = 0.454

- When 180° < x < 270°, sin x = – sin (x – 180°)
  
  For example, sin 214° = – sin (214° – 180°) = – sin 34° = – 0.559

- When 270° < x < 360°, sin x = – sin (360° – x)
  
  For example, sin 287° = – sin (360° – 287°) = – sin 73° = – 0.956

Copy and complete this table using your calculator and rounding off to three decimal places.

Comment on what you notice about the sine of each acute angle, and the sines of its corresponding non-acute angles.

d Comment on any symmetries your graph has.

Draw a graph of $\sin x$ against $x$. Take $x$ from 0° to 360° and $\sin x$ from –1 to 1.
CHAPTER 15: TRIGONOMETRY

Note:

- Each and every value of sine between –1 and 1 gives two angles between 0° and 360°.
- When the value of sine is positive, both angles are between 0° and 180°.
- When the value of sine is negative, both angles are between 180° and 360°.
- You can use the sine graph from 0° to 360° to check values approximately.

EXAMPLE 5

Find the angles with a sine of 0.56.
You know that both angles are between 0° and 180°.
Using your calculator to find \( \sin^{-1} 0.56 \), you obtain 34.1°.
The other angle is, therefore,
\[ 180° - 34.1° = 145.9° \]
So, the angles are 34.1° and 145.9°.

EXAMPLE 6

Find the angles with a sine of –0.197.
You know that both angles are between 180° and 360°.
Using your calculator to find \( \sin^{-1} 0.197 \), you obtain 11.4°.
So the angles are
\[ 180° + 11.4° \quad \text{and} \quad 360° - 11.4° \]
which give 191.4° and 348.6°.

You can always use your calculator to check your answer to this type of problem by first keying in the angle and the appropriate trigonometric function (which would be sine in the above examples).
Paragraph: State the two angles between 0° and 360° for each of these sine values.

</tr>
</tbody>
</table>

You should have discovered these three facts.

- When 90° < x < 180°, cos x = - cos (180° - x)
  For example, cos 161° = - cos (180° - 161°) = - cos 19° = -0.946 (3 significant figures)

- When 180° < x < 270°, cos x = - cos (x - 180°)
  For example, cos 245° = - cos (245° - 180°) = - cos 65° = -0.423 (3 significant figures)

- When 270° < x < 360°, cos x = cos (360° - x)
  For example, cos 310° = cos (360° - 310°) = cos 50° = 0.643 (3 significant figures)
Note:
- Each and every value of cosine between $-1$ and $1$ gives two angles between $0^\circ$ and $360^\circ$.
- When the value of cosine is positive, one angle is between $0^\circ$ and $90^\circ$, and the other is between $270^\circ$ and $360^\circ$.
- When the value of cosine is negative, both angles are between $90^\circ$ and $270^\circ$.
- You can use the cosine graph from $0^\circ$ to $360^\circ$ to check values approximately.

**EXAMPLE 7**

Find the angles with a cosine of $0.75$.

One angle is between $0^\circ$ and $90^\circ$, and the other is between $270^\circ$ and $360^\circ$.

Using your calculator to find $\cos^{-1} 0.75$, you obtain $41.4^\circ$.

The other angle is, therefore,

$360^\circ - 41.4^\circ = 318.6^\circ$

So, the angles are $41.4^\circ$ and $318.6^\circ$.

**EXAMPLE 8**

Find the angles with a cosine of $-0.285$.

You know that both angles are between $90^\circ$ and $270^\circ$.

Using your calculator to find $\cos^{-1} 0.285$, you obtain $73.4^\circ$.

The two angles are, therefore,

$180^\circ - 73.4^\circ$ and $180^\circ + 73.4^\circ$

which give $106.6^\circ$ and $253.4^\circ$.

Here again, you can use your calculator to check your answer, by keying in cosine.

**EXERCISE 15D**

State the two angles between $0^\circ$ and $360^\circ$ for each of these cosine values.

1. $0.6$
2. $0.58$
3. $0.458$
4. $0.575$
5. $0.185$
6. $-0.8$
7. $-0.25$
8. $-0.175$
9. $-0.361$
10. $-0.974$
11. $0.196$
12. $0.714$

Write down the sine of each of these angles.

1. a 135°  
2. b 269°  
3. c 305°  
4. d 133°

Write down the cosine of each of these angles.

1. a 129°  
2. b 209°  
3. c 95°  
4. d 357°

Write down the two possible values of \( x \) (0° < \( x \) < 360°) for each equation. Give your answers to one decimal place.

1. a \( \sin x = 0.361 \)  
2. b \( \sin x = -0.486 \)  
3. c \( \cos x = 0.641 \)  
4. d \( \cos x = -0.866 \)  
5. e \( \sin x = 0.874 \)  
6. f \( \cos x = 0.874 \)

Find two angles such that the sine of each is 0.5.

1. cos 41° = 0.755. What is cos 139°?

Write down the value of each of the following, correct to three significant figures.

1. a \( \sin 50° + \cos 50° \)  
2. b \( \cos 120° - \sin 120° \)  
3. c \( \sin 136° + \cos 223° \)  
4. d \( \sin 175° + \cos 257° \)  
5. e \( \sin 114° - \sin 210° \)  
6. f \( \cos 123° + \sin 177° \)

It is suggested that \((\sin x)^2 + (\cos x)^2 = 1\) is true for all values of \( x \). Test out this suggestion to see if you agree.

Suppose the sine key on your calculator is broken, but not the cosine key. Show how you could calculate these.

1. a \( \sin 25° \)  
2. b \( \sin 130° \)

Find a solution to each of these equations.

1. a \( \sin (x + 20°) = 0.5 \)  
2. b \( \cos (5x) = 0.45 \)

By any suitable method, find the solution to the equation \( \sin x = (\cos x)^2 \).
CHAPTER 15: TRIGONOMETRY

ACTIVITY

a Try to find $\tan 90^\circ$. What do you notice?

Which is the closest angle to $90^\circ$ for which you can find the tangent on your calculator?

What is the largest value for tangent that you can get on your calculator?

b Find values of $\tan x$ where $0^\circ < x < 360^\circ$. Draw a graph of your results.

State some rules for finding both angles between $0^\circ$ and $360^\circ$ that have any given tangent.

EXAMPLE 9

Find the angles between $0^\circ$ and $360^\circ$ with a tangent of $0.875$.

One angle is between $0^\circ$ and $90^\circ$, and the other is between $180^\circ$ and $270^\circ$.

Using your calculator to find $\tan^{-1} 0.875$, you obtain $41.2^\circ$.

The other angle is, therefore,

$$180^\circ + 41.2^\circ = 221.2^\circ$$

So, the angles are $41.2^\circ$ and $221.2^\circ$.

EXAMPLE 10

Find the angles between $0^\circ$ and $360^\circ$ with a tangent of $–1.5$.

We know that one angle is between $90^\circ$ and $180^\circ$, and that the other is between $270^\circ$ and $360^\circ$.

Using your calculator to find $\tan^{-1} 1.5$, you obtain $56.3^\circ$.

The angles are, therefore,

$$180^\circ – 56.3^\circ \text{ and } 360^\circ – 56.3^\circ$$

which give $123.7^\circ$ and $303.7^\circ$. 
State the angles between 0° and 360° which have each of these tangent values.

1. 0.258
2. 0.785
3. 1.19
4. 1.875
5. 2.55
6. -0.358
7. -0.634
8. -0.987
9. -1.67
10. -3.68
11. 1.397
12. 0.907
13. -0.355
14. -1.153
15. 4.15
16. -2.05
17. -0.098
18. 0.998
19. 1.208
20. -2.5

**15.4 Solving any triangle**

This section will show you how to:
- find the sides and angles of any triangle whether it has a right angle or not

**Key words**
- cosine rule
- included angle
- sine rule

We have already established that any triangle has six elements: three sides and three angles. To solve a triangle (that is, to find any unknown angles or sides), we need to know at least three of the elements. Any combination of three elements – except that of all three angles – is enough to work out the rest. In a right-angled triangle, one of the known elements is, of course, the right angle.

When we need to solve a triangle which contains no right angle, we can use one or the other of two rules, depending on what is known about the triangle. These are the **sine rule** and the **cosine rule**.

**The sine rule**

Take a triangle ABC and draw the perpendicular from A to the opposite side BC.

From right-angled triangle ADB

\[ h = c \sin B \]

From right-angled triangle ADC

\[ h = b \sin C \]
Therefore, \(c \sin B = b \sin C\) which can be rearranged to give
\[
\frac{c}{\sin C} = \frac{b}{\sin B}
\]
By drawing a perpendicular from each of the other two vertices to the opposite side (or by algebraic symmetry), we see that
\[
\frac{a}{\sin A} = \frac{c}{\sin C} \quad \text{and that} \quad \frac{a}{\sin A} = \frac{b}{\sin B}
\]
These are usually combined in the form
\[
\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}
\]
which can be inverted to give
\[
\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}
\]
Usually, a triangle is not conveniently labelled as in these diagrams. So, when using the sine rule, it is easier to remember to proceed as follows: take each side in turn, divide it by the sine of the angle opposite, and then equate the resulting quotients.

**Note:**
- When you are calculating a side, use the rule with the sides on top.
- When you are calculating an angle, use the rule with the sines on top.

**EXAMPLE 11**

In triangle ABC, find the value of \(x\).

Use the sine rule with sides on top, which gives
\[
\frac{x}{\sin 84^\circ} = \frac{25}{\sin 47^\circ}
\]
\[
\Rightarrow x = \frac{25 \sin 84^\circ}{\sin 47^\circ} = 34.0 \text{ cm} \quad (3 \text{ significant figures})
\]
EXAMPLE 12

In the triangle ABC, find the value of the acute angle $x$.

Use the sine rule with sines on top, which gives

$$\frac{\sin x}{7} = \frac{\sin 40^\circ}{6}$$

$$\Rightarrow \sin x = \frac{7 \sin 40^\circ}{6} = 0.7499$$

$$\Rightarrow x = \sin^{-1} 0.7499 = 48.6^\circ \quad (3 \text{ significant figures})$$

EXAMPLE 13

In triangle ABC, AB = 9 cm, AC = 7 cm and angle ABC = 40°. Find the angle ACB.

As you sketch triangle ABC, note that C can have two positions, giving two different configurations.

But you still proceed as in the normal sine rule situation, obtaining

$$\frac{\sin C}{9} = \frac{\sin 40^\circ}{7}$$

$$\Rightarrow \sin C = \frac{9 \sin 40^\circ}{7} = 0.8264$$

Keying inverse sine on our calculator gives $C = 55.7^\circ$. But there is another angle with a sine of 0.8264, given by $(180^\circ - 55.7^\circ) = 124.3^\circ$.

These two values for $C$ give the two different situations shown above.

When an illustration of the triangle is given, it will be clear whether the required angle is acute or obtuse. When an illustration is not given, the more likely answer is an acute angle.

Examiners will not try to catch you out with the ambiguous case. They will indicate clearly, either with the aid of a diagram or by stating it, what is required.
1. Find the length $x$ in each of these triangles.

   a. 
   
   b. 
   
   c. 

2. Find the angle $x$ in each of these triangles.

   a. 
   
   b. 
   
   c. 

3. In triangle ABC, the angle at A is 38°, the side AB is 10 cm and the side BC is 8 cm. Find the two possible values of the angle at C.

4. In triangle ABC, the angle at A is 42°, the side AB is 16 cm and the side BC is 14 cm. Find the two possible values of the side AC.

5. To find the height of a tower standing on a small hill, Mary made some measurements (see diagram).

   From a point B, the angle of elevation of C is 20°, the angle of elevation of A is 50°, and the distance BC is 25 m.

   a. Calculate these angles.

      i. ABC

      ii. BAC

   b. Using the sine rule and triangle ABC, calculate the height $h$ of the tower.
6 Use the information on this sketch to calculate the width, \( w \), of the river.

![Image of a river with a 40° and 80° angle and 50 m distance]

7 An old building is unsafe, so it is protected by a fence. To work out the height of the building, Annie made the measurements shown on the diagram.

   a Use the sine rule to work out the distance AB.
   b Calculate the height of the building, BD.

![Image of a building with angles 37° and 113° and 20 m distance]

8 A weight is hung from a horizontal beam using two strings. The shorter string is 2.5 m long and makes an angle of 71° with the horizontal. The longer string makes an angle of 43° with the horizontal. What is the length of the longer string?

9 An aircraft is flying over an army base. Suddenly, two searchlights, 3 km apart, are switched on. The two beams of light meet on the aircraft at an angle of 125° vertically above the line joining the searchlights. One of the beams of light makes an angle of 31° with the horizontal. Calculate the height of the aircraft.

10 Two ships leave a port in directions that are 41° from each other. After half an hour, the ships are 11 km apart. If the speed of the slower ship is 7 km/h, what is the speed of the faster ship?

11 For any triangle ABC, prove the sine rule

\[
\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}
\]

**The cosine rule**

Take the triangle, shown on the right, where D is the foot of the perpendicular to BC from A.

Using Pythagoras on triangle BDA

\[ h^2 = c^2 - x^2 \]

Using Pythagoras on triangle ADC

\[ h^2 = b^2 - (a - x)^2 \]
Therefore,
\[ c^2 - x^2 = b^2 - (a - x)^2 \]
\[ c^2 - x^2 = b^2 - a^2 + 2ax - x^2 \]
\[ \Rightarrow c^2 = b^2 - a^2 + 2ax \]

From triangle BDA, \( x = c \cos B \).

Hence
\[ c^2 = b^2 - a^2 + 2ac \cos B \]

Rearranging gives
\[ b^2 = a^2 + c^2 - 2ac \cos B \]

By algebraic symmetry
\[ a^2 = b^2 + c^2 - 2bc \cos A \]
\[ c^2 = a^2 + b^2 - 2ab \cos C \]

This is the cosine rule, which can be best remembered by the diagram on the right, where
\[ a^2 = b^2 + c^2 - 2bc \cos A \]

Note the symmetry of the rule and how the rule works using two adjacent sides and the angle between them.

The formula can be rearranged to find any of the three angles

\[ \cos A = \frac{b^2 + c^2 - a^2}{2bc} \]
\[ \cos B = \frac{a^2 + c^2 - b^2}{2ac} \]
\[ \cos C = \frac{a^2 + b^2 - c^2}{2ab} \]

Note that the cosine rule \( a^2 = b^2 + c^2 - 2bc \cos A \) is given in the formula sheets in the GCSE examination but the rearranged formula for the angle is not given. You are advised to learn this as trying to rearrange usually ends up with an incorrect formula.

**EXAMPLE 14**

Find \( x \) in this triangle.

By the cosine rule
\[ x^2 = 6^2 + 10^2 - 2 \times 6 \times 10 \times \cos 80^\circ \]
\[ x^2 = 115.16 \]
\[ \Rightarrow x = 10.7 \quad (3 \text{ significant figures}) \]
**EXAMPLE 15**

Find \( x \) in this triangle.

By the cosine rule

\[
\cos x = \frac{5^2 + 7^2 - 8^2}{2 \times 5 \times 7} = 0.1428
\]

\[\Rightarrow x = 81.8^\circ \quad \text{(3 significant figures)}\]

**EXAMPLE 16**

A ship sails from a port on a bearing of 055° for 40 km. It then changes course to 123° for another 50 km. On what course should the ship be steered to get it straight back to the port?

Previously, you have solved this type of problem using right-angled triangles. This method could be applied here but it would involve at least six separate calculations.

With the aid of the cosine and sine rules, however, you can reduce the solution to two separate calculations, as follows.

The course diagram gives the triangle PAB (on the right), where angle PAB is found by using alternate angles and angles on a line.

\[55^\circ + (180^\circ - 123^\circ) = 112^\circ\]

Let \( \phi \) be the bearing to be steered, then

\[\phi = \theta + 55^\circ + 180^\circ\]

To find \( \theta \), you first have to obtain PB(= \( x \)), using the cosine rule.

\[x^2 = 40^2 + 50^2 - 2 \times 40 \times 50 \times \cos 112^\circ \text{ km}^2\]

(\text{Remember: the cosine of } 112^\circ \text{ is negative.})

\[\Rightarrow x^2 = 5598.43 \text{ km}^2\]

\[\Rightarrow x = 74.82 \text{ km}\]

You can now find \( \theta \) from the sine rule.

\[\frac{\sin \theta}{50} = \frac{\sin 112^\circ}{74.82}\]

\[\Rightarrow \sin \theta = \frac{50 \times \sin 112^\circ}{74.82} = 0.6196\]

\[\Rightarrow \theta = 38.3^\circ\]

So the ship should be steered on a bearing of

\[38.3^\circ + 55^\circ + 180^\circ = 273.3^\circ\]
Find the length $x$ in each of these triangles.

1. $\triangle ABC$ with $AB = 6$ m, $BC = 8$ m, and $\angle BAC = 65^\circ$.
2. $\triangle ABC$ with $AB = 22$ cm, $BC = 15$ cm, and $\angle ABC = 102^\circ$.
3. $\triangle ABC$ with $AB = 32$ cm, $BC = 37$ cm, and $\angle BAC = 45^\circ$.

Find the angle $x$ in each of these triangles.

1. $\triangle ABC$ with $AB = 7$ m, $BC = 9$ m, and $\angle BAC = \theta$.
2. $\triangle ABC$ with $AB = 15$ cm, $BC = 24$ cm, and $\angle ABC = \theta$.
3. $\triangle ABC$ with $AB = 30$ cm, $BC = 40$ cm, and $\angle ABC = \theta$.

d. Explain the significance of the answer to part c.

3. In triangle $ABC$, $AB = 5$ cm, $BC = 6$ cm and angle $ABC = 55^\circ$. Find $AC$.

4. A triangle has two sides of length 40 cm and an angle of 110°. Work out the length of the third side of the triangle.

5. The diagram shows a trapezium $ABCD$. $AB = 6.7$ cm, $AD = 7.2$ cm, $CB = 9.3$ cm and angle $DAB = 100^\circ$. Calculate these.
   - length $DB$
   - angle $DBA$
   - angle $DBC$
   - length $DC$
   - area of the trapezium

6. A quadrilateral $ABCD$ has $AD = 6$ cm, $DC = 9$ cm, $AB = 10$ cm and $BC = 12$ cm. Angle $ADC = 120^\circ$. Calculate angle $ABC$.

7. A triangle has two sides of length 30 cm and an angle of 50°. Unfortunately, the position of the angle is not known. Sketch the two possible triangles and use them to work out the two possible lengths of the third side of the triangle.

8. A ship sails from a port on a bearing of 050° for 50 km then turns on a bearing of 150° for 40 km. A crewman is taken ill, so the ship drops anchor. What course and distance should a rescue helicopter from the port fly to reach the ship in the shortest possible time?
The three sides of a triangle are given as $3a$, $5a$ and $7a$. Calculate the smallest angle in the triangle.

ABCD is a trapezium where AB is parallel to CD. AB = 4 cm, BC = 5 cm, CD = 8 cm, DA = 6 cm. A line BX is parallel to AD and cuts DC at X. Calculate these.

- a angle BCD
- b length BD

For any triangle ABC prove the cosine rule

$$a^2 = b^2 + c^2 - 2bc \cos A$$

### Choosing the correct rule

When solving triangles, there are only four situations that can occur, each of which can be solved completely in three stages.

**Two sides and the included angle**

1. Use the cosine rule to find the third side.
2. Use the sine rule to find either of the other angles.
3. Use the sum of the angles in a triangle to find the third angle.

**Two angles and a side**

1. Use the sum of the angles in a triangle to find the third angle.
2. Use the sine rule to find the other two sides.

**Three sides**

1. Use the cosine rule to find one angle.
2. Use the sine rule to find another angle.
3. Use the sum of the angles in a triangle to find the third angle.

**Two sides and a non-included angle**

This is the ambiguous case already covered (page 347).

1. Use the sine rule to find the two possible values of the appropriate angle.
2. Use the sum of the angles in a triangle to find the two possible values of the third angle.
3. Use the sine rule to find the two possible values for the length of the third side.

**Note:** Apply the sine rule wherever you can – it is always easier to use than the cosine rule. The cosine rule should never need to be used more than once.
1. Find the length or angle $x$ in each of these triangles.

2. The hands of a clock have lengths 3 cm and 5 cm. Find the distance between the tips of the hands at 4 o'clock.

3. A spacecraft is seen hovering at a point which is in the same vertical plane as two towns, X and F. Its distances from X and F are 8.5 km and 12 km respectively. The angle of elevation of the spacecraft when observed from F is 43°. Calculate the distance between the two towns.

4. Two boats, Mary Jo and Suzie, leave port at the same time. Mary Jo sails at 10 knots on a bearing of 065°. Suzie sails on a bearing of 120° and after 1 hour Mary Jo is on a bearing of 330° from Suzie. What is Suzie's speed? (A knot is a nautical mile per hour.)

5. Two ships leave port at the same time, Darling Dave sailing at 12 knots on a bearing of 055°, and Merry Mary at 18 knots on a bearing of 280°.
   a. How far apart are the two ships after 1 hour?
   b. What is the bearing of Merry Mary from Darling Dave?
In this section you will learn how to:

- work out the trigonometric ratios of 30°, 45° and 60° in surd form

### EXAMPLE 17

Using an equilateral triangle whose sides are 2 units, write down expressions for the sine, cosine and tangent of 60° and 30°.

Divide the equilateral triangle into two equal right-angled triangles. Taking one of them, use Pythagoras and the definition of sine, cosine and tangent to obtain:

\[
\sin 60° = \frac{\sqrt{3}}{2} \quad \cos 60° = \frac{1}{2} \quad \tan 60° = \sqrt{3}
\]

and

\[
\sin 30° = \frac{1}{2} \quad \cos 30° = \frac{\sqrt{3}}{2} \quad \tan 30° = \frac{1}{\sqrt{3}} = \frac{\sqrt{3}}{3}
\]

### EXAMPLE 18

Using a right-angled isosceles triangle whose equal sides are 1 unit, find the sine, cosine and tangent of 45°.

By Pythagoras, the hypotenuse of the triangle is \(\sqrt{2}\) units.

From the definition of sine, cosine and tangent, you obtain:

\[
\sin 45° = \frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{2} \quad \cos 45° = \frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{2} \quad \tan 45° = 1
\]

The sine of angle $x$ is $\frac{4}{5}$. Work out the cosine of angle $x$.

The cosine of angle $x$ is $\frac{3}{\sqrt{15}}$. Work out the sine of angle $x$.

The two short sides of a right-angled triangle are $\sqrt{6}$ and $\sqrt{13}$. Write down the exact value of the hypotenuse of this triangle, and the exact value of the sine, cosine and tangent of the smallest angle in the triangle.

The tangent of angle $A$ is $\frac{6}{11}$. Use this fact to label two sides of the triangle.

- Calculate the third side of the triangle.
- Write down the exact values of $\sin A$ and $\cos A$.

Calculate the exact value of the area of an equilateral triangle of side 6 cm.

Work out the exact value of the area of a right-angled isosceles triangle whose hypotenuse is 40 cm.

Using sine to find the area of a triangle

This section will show you how to:

- work out the area of a triangle if you know two sides and the included angle

Take triangle ABC, whose vertical height is BD and whose base is AC.

Let $BD = h$ and $AC = b$, then the area of the triangle is given by

$$\frac{1}{2} \times AC \times BD = \frac{1}{2}bh$$

However, in triangle BCD

$$h = BC \sin C = a \sin C$$

where $BC = a$. 

Substituting into $\frac{1}{2}bh$ gives

$$\frac{1}{2}b \times (a \sin C) = \frac{1}{2}ab \sin C$$

as the area of the triangle.

By taking the perpendicular from A to its opposite side BC, and the perpendicular from C to its opposite side AB, we can show that the area of the triangle is also given by

$$\frac{1}{2}ac \sin B \quad \text{and} \quad \frac{1}{2}bc \sin A$$

Note the pattern: the area is given by the product of two sides multiplied by the sine of the included angle.

**EXAMPLE 19**

Find the area of triangle ABC.

Area = $\frac{1}{2}ab \sin C$

Area = $\frac{1}{2} \times 5 \times 7 \times \sin 38^\circ = 10.8 \text{ cm}^2$ (3 significant figures)

**EXAMPLE 20**

Find the area of triangle ABC.

You have all three sides but no angle. So first you must find an angle in order to apply the area sine rule.

Find angle C, using the cosine rule.

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab}$$

$$= \frac{13^2 + 19^2 - 8^2}{2 \times 13 \times 19} = 0.9433$$

$$\Rightarrow C = \cos^{-1} 0.9433 = 19.4^\circ$$

(Keep the exact value in your calculator memory.)

Now you apply the area sine rule

$$\frac{1}{2}ab \sin C = \frac{1}{2} \times 13 \times 19 \times \sin 19.4^\circ$$

$$= 41.0 \text{ cm}^2$$ (3 significant figures)
1. Find the area of each of the following triangles.
   a. Triangle ABC where BC = 7 cm, AC = 8 cm and angle ACB = 59°
   b. Triangle ABC where angle BAC = 86°, AC = 6.7 cm and AB = 8 cm
   c. Triangle PQR where QR = 27 cm, PR = 19 cm and angle QRP = 109°
   d. Triangle XYZ where XY = 231 cm, XZ = 191 cm and angle YXZ = 73°
   e. Triangle LMN where LN = 63 cm, LM = 39 cm and angle NLM = 85°

2. The area of triangle ABC is 27 cm². If BC = 14 cm and angle BCA = 115°, find AC.

3. The area of triangle LMN is 113 cm², LM = 16 cm and MN = 21 cm. Angle LMN is acute. Calculate these angles.
   a. LMN
   b. MNL

4. In a quadrilateral ABCD, DC = 4 cm, BD = 11 cm, angle BAD = 32°, angle ABD = 48° and angle BDC = 61°. Calculate the area of the quadrilateral.

5. A board is in the shape of a triangle with sides 60 cm, 70 cm and 80 cm. Find the area of the board.

6. Two circles, centres P and Q, have radii of 6 cm and 7 cm respectively. The circles intersect at X and Y. Given that PQ = 9 cm, find the area of triangle PXQ.

7. The points A, B and C are on the circumference of a circle, centre O and radius 7 cm. AB = 4 cm and BC = 3.5 cm. Calculate these.
   a. angle AOB
   b. area of quadrilateral OABC

8. Prove that for any triangle ABC
   \[ \text{Area} = \frac{1}{2}ab \sin C \]

9. a. ABC is a right-angled isosceles triangle with short sides of 1 cm. Write down the value of \( \sin 45° \).
   b. Calculate the area of triangle PQR.
The diagram shows triangle ABC.

BC = 8.5 cm.
Angle ABC = 90°.
Angle ACB = 38°.

Work out the length of AB. Give your answer correct to 3 significant figures.

Edexcel, Question 21, Paper 4 Intermediate, June 2003

ABD and BCD are two right-angled triangles.
AB = 9 cm, CD = 6 cm, ∠BAD = 35°.

The two triangles are joined together as shown in the diagram. ADC is a straight line. Calculate the length BC, marked x on the diagram.

Edexcel, Question 21, Paper 4 Intermediate, June 2003

ABC is a right-angled triangle.
AB = 7 cm, ∠CAB = 52°.
Find the length of BC (marked x in the diagram). Give your answer to a suitable degree of accuracy.

Edexcel, Question 21, Paper 4 Intermediate, June 2003

PQR is a triangle.
PQ = 12 cm, PR = 15 cm, QR = 20 cm.

Calculate the angle QPR.

Edexcel, Question 11, Paper 19 Higher, June 2004

ADC is a right-angled triangle. Point B is such that CBD = 38°, CAB = 21° and AB = 15 cm. Calculate the length of CD.

Edexcel, Question 11, Paper 19 Higher, June 2004

In triangle PQR, PQ = 13 cm, QR = 11 cm and PR = 12 cm.

Find the area of triangle PQR.

Edexcel, Question 11, Paper 19 Higher, June 2004

Two boats, P and Q, leave harbour at 10 am. Boat P sails at a constant speed of 21 km/h on a bearing of 075°. Boat Q sails at a constant speed of 30 km/h on a bearing of 163°.

Calculate the distance between the two boats at 11 am.

Edexcel, Question 11, Paper 19 Higher, June 2004

The diagram represents a prism.
AEFD is a rectangle.
ABCD is a square.
EB and FC are perpendicular to plane ABCD.
AB = 60 cm.
AD = 60 cm.
Angle ABE = 90°
Angle BAE = 30°.

Calculate the size of the angle that the line DE makes with the plane ABCD. Give your answer correct to 1 decimal place.

Edexcel, Question 11, Paper 19 Higher, June 2004

In triangle PQR, PR = 6 cm, PQ = 10 cm and angle PRQ = 105°.

Calculate the area of triangle PQR.

VABCD is a right pyramid with a square base.
V is vertically above the centre of the square.
All the slant lengths are 30 cm.
The square base has a side of 20 cm.

Calculate the angle between the face VAB and the base ABCD.

The base of the pyramid is a regular hexagon with sides of length 2 cm. O is the centre of the base.

The diagram shows a pyramid. The apex of the pyramid is V. Each of the sloping edges is of length 6 cm.

The volume of the pyramid is 200 cm³.

Find the length of the slant edge of the pyramid.
WORKED EXAM QUESTIONS

The diagram represents a level triangular piece of land. AB = 61 metres, AC = 76 metres, and the area of the land is 2300 m². Angle BAC is acute. Calculate the length of BC. Give your answer to an appropriate degree of accuracy.

Solution

\[
\frac{1}{2} \times 61 \times 76 \times \sin BAC = 2300
\]

\[
\therefore \sin BAC = 0.9922 \ldots
\]

\[
\therefore \text{Angle } BAC = 82.9^\circ
\]

\[
BC^2 = 61^2 + 76^2 - 2 \times 61 \times 76 \times \cos 82.9^\circ = 8343.75
\]

\[
BC = 91.3 \text{ m}
\]

A tetrahedron has one face which is an equilateral triangle of side 6 cm and three faces which are isosceles triangles with sides 6 cm, 9 cm and 9 cm. Calculate the surface area of the tetrahedron.

Solution

First work out the area of the base, which has angles of 60°.

\[
\text{Area base} = \frac{1}{2} \times 6 \times 6 \times \sin 60^\circ = 15.59 \text{ cm}^2
\]

(4 significant figures)

Next, work out the vertex angle of one side triangle using the cosine rule.

\[
\cos x = \frac{9^2 + 9^2 - 6^2}{2 \times 9 \times 9}
\]

So

\[
x = 38.9^\circ
\]

(Keep the exact value in your calculator.)

Work out the area of one side face and then add all faces together.

\[
\text{Area side face} = \frac{1}{2} \times 9 \times 9 \times \sin 38.9^\circ = 25.46 \text{ cm}^2
\]

(4 significant figures)

Total area = 3 \times 25.46 + 15.59 = 92.0 \text{ cm}^2

(3 significant figures)
GRADE YOURSELF

- Able to solve more complex 2-D problems using Pythagoras’ theorem and trigonometry
- Able to use the sine and cosine rules to calculate missing angles or sides in non right-angled triangles
- Able to find the area of a triangle using the formula Area = \( \frac{1}{2}ab \sin C \)
- Able to use the sine and cosine rules to solve more complex problems involving non right-angled triangles
- Able to solve 3-D problems using Pythagoras’ theorem and trigonometric ratios
- Able to find two angles between 0° and 360° for any given value of a trigonometric ratio (positive or negative)
- Able to solve simple equations where the trigonometric ratio is the subject

What you should know now

- How to use the sine and cosine rules
- How to find the area of a triangle using Area = \( \frac{1}{2}ab \sin C \)
This chapter will show you ...

- how to draw and find the equations of linear graphs
- how to use graphs to find exact or approximate solutions to equations

What you should already know

- How to read and plot coordinates
- How to substitute into simple algebraic functions
- How to plot a graph from a given table of values

Quick check  ➤ ANSWERS

1. This table shows values of $y = 2x + 3$ for $-2 \leq x \leq 5$.

<table>
<thead>
<tr>
<th>$x$</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td>-1</td>
<td>1</td>
<td>3</td>
<td>5</td>
<td>7</td>
<td>9</td>
<td>11</td>
<td></td>
</tr>
</tbody>
</table>

a. Complete the table for $x = 5$

b. Copy these axes and plot the points to draw the graph of $y = 2x + 3$. 
This chapter is concerned with drawing straight-line graphs. These graphs are usually referred to as **linear graphs**.

The minimum number of points needed to draw a linear graph is two but three or more are better because that gives at least one point to act as a check. There is no rule about how many points to plot but here are some tips.

- Use a sharp pencil and mark each point with an accurate cross.
- Get your eyes directly over the graph. If you look from the side, you will not be able to line up your ruler accurately.

**Drawing graphs by finding points**

This method is a bit quicker and does not need flow diagrams. However, if you prefer flow diagrams, use them. Follow through Example 1 to see how to draw a graph by finding points.

**EXAMPLE 1**

Draw the graph of \( y = 4x - 5 \) for values of \( x \) from 0 to 5. This is usually written as \( 0 \leq x \leq 5 \).

Choose three values for \( x \): these should be the highest and lowest \( x \)-values and one in between.

Work out the \( y \)-values by substituting the \( x \)-values into the equation.

When \( x = 0 \), \( y = 4(0) - 5 = -5 \). This gives the point (0, -5).

When \( x = 3 \), \( y = 4(3) - 5 = 7 \). This gives the point (3, 7).

When \( x = 5 \), \( y = 4(5) - 5 = 15 \). This gives the point (5, 15).

Keep a record of your calculations in a table.

<table>
<thead>
<tr>
<th>( x )</th>
<th>0</th>
<th>3</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>-5</td>
<td>7</td>
<td>15</td>
</tr>
</tbody>
</table>

You now have to decide the extent (range) of the **axes**. You can find this out by looking at the coordinates that you have so far. The smallest \( x \)-value is 0, the largest is 5. The smallest \( y \)-value is -5, the largest is 15.

Now draw the axes, plot the points and complete the graph. It is usually a good idea to choose 0 as one of the \( x \)-values. In an examination, the range for the \( x \)-values will usually be given and the axes already drawn.
Read through these hints before drawing the linear graphs required in Exercise 16A.

- Use the highest and lowest values of \( x \) given in the range.
- Don’t pick \( x \)-values that are too close together, for example, 1 and 2. Try to space them out so that you can draw a more accurate graph.
- Always label your graph with its equation. This is particularly important when you are drawing two graphs on the same set of axes.
- If you want to use a flow diagram, use one.
- Create a table of values. You will often have to complete these in your examinations.

**EXERCISE 16A**

\[ y = 3x + 4 \text{ for } x \in [0, 5] \]
\[ y = 2x - 5 \text{ for } x \in [0, 5] \]
\[ y = \frac{x}{2} - 3 \text{ for } x \in [0, 10] \]
\[ y = 3x + 5 \text{ for } -3 \leq x \leq 3 \]
\[ y = \frac{x}{3} + 4 \text{ for } -6 \leq x \leq 6 \]

\( a \) On the same set of axes, draw the graphs of \( y = 3x - 2 \) and \( y = 2x + 1 \) for \( 0 \leq x \leq 5 \).

\( b \) At which point do the two lines intersect?

\( a \) On the same axes, draw the graphs of \( y = 4x - 5 \) and \( y = 2x + 3 \) for \( 0 \leq x \leq 5 \).

\( b \) At which point do the two lines intersect?

\( a \) On the same axes, draw the graphs of \( y = \frac{x}{3} - 1 \) and \( y = \frac{x}{2} - 2 \) for \( 0 \leq x \leq 12 \).

\( b \) At which point do the two lines intersect?

\( a \) On the same axes, draw the graphs of \( y = 3x + 1 \) and \( y = 3x - 2 \) for \( 0 \leq x \leq 4 \).

\( b \) Do the two lines intersect? If not, why not?

\( a \) Copy and complete the table to draw the graph of \( x + y = 5 \) for \( 0 \leq x \leq 5 \).

\[
\begin{array}{c|ccccc}
 x & 0 & 1 & 2 & 3 & 4 \\
 y & 5 & 3 & 1 & & \\
\end{array}
\]

\( b \) Now draw the graph of \( x + y = 7 \) for \( 0 \leq x \leq 7 \) on the same axes.
Gradient

The slope of a line is called its gradient. The steeper the slope of the line, the larger the value of the gradient.

The gradient of the line shown here can be measured by drawing, as large as possible, a right-angled triangle which has part of the line as its hypotenuse (sloping side). The gradient is then given by:

\[
\text{gradient} = \frac{\text{distance measured up}}{\text{distance measured along}} = \frac{\text{difference on } y\text{-axis}}{\text{difference on } x\text{-axis}}
\]

For example, to measure the steepness of the line in the next figure, you first draw a right-angled triangle whose hypotenuse is part of this line. It does not matter where you draw the triangle but it makes the calculations much easier if you choose a sensible place. This usually means using existing grid lines, so that you avoid fractional values.

After you have drawn the triangle, you measure (or count) how many squares there are on the vertical side. This is the difference between your \(y\)-coordinates. In the case above, this is 2.

You then measure (or count) how many squares there are on the horizontal side. This is the difference between your \(x\)-coordinates. In the case above, this is 4.

To work out the gradient, you do the following calculation.

\[
\text{gradient} = \frac{\text{difference of the } y\text{-coordinates}}{\text{difference of the } x\text{-coordinates}} = \frac{2}{4} = \frac{1}{2} \text{ or } 0.5
\]

Note that the value of the gradient is not affected by where the triangle is drawn. As we are calculating the ratio of two sides of the triangle, the gradient will always be the same wherever we draw the triangle.

**Remember:** When a line slopes down from left to right, the gradient is negative, so a minus sign must be placed in front of the calculated fraction.
**Drawing a line with a certain gradient**

To draw a line with a certain gradient, you reverse the process described above. That is, you first draw the right-angled triangle using the given gradient. For example, take a gradient of 2.

Start at a convenient point (A in the diagrams below). A gradient of 2 means for an x-step of 1 the y-step must be 2 (because 2 is the fraction $\frac{2}{1}$). So, move one square across and two squares up, and mark a dot.

Repeat this as many times as you like and draw the line. You can also move one square back and two squares down, which gives the same gradient, as the third diagram shows.

---

**EXAMPLE 2**

Find the gradient of each of these lines.

- **a** y difference = 6, x difference = 4  
  Gradient = $\frac{6 - 4}{4} = \frac{2}{2} = 1.5$
- **b** y difference = 3, x difference = 12  
  Line slopes down left to right,  
  so gradient = $-(\frac{3}{12}) = -\frac{1}{4} = -0.25$
- **c** y difference = 5, x difference = 2  
  Line slopes down from left to right,  
  so gradient = $-(\frac{5}{2}) = -\frac{5}{2} = -2.5$
- **d** y difference = 1, x difference = 4  
  Gradient = $\frac{1 - 4}{4} = -\frac{3}{4}$

---

EXAMPLE 3

Draw lines with these gradients. \( a \frac{1}{3} \quad b \quad c \quad \frac{1}{2} \)

- **a** This is a fractional gradient which has a \( y \)-step of 1 and an \( x \)-step of 3. Move three squares across and one square up every time.
- **b** This is a negative gradient, so for every one square across, move three squares down.
- **c** This is also a negative gradient and it is a fraction. So for every four squares across, move one square down.

EXERCISE 16B

1. Find the gradient of each of these lines.

2. Draw lines with these gradients.
   - **a** 4
   - **b** \( \frac{1}{3} \)
   - **c** -2
   - **d** \( \frac{4}{5} \)
   - **e** 6
   - **f** -6

3. Find the gradient of each of these lines. What is special about these lines?

The line on grid e is horizontal. The lines on grids a to d get nearer and nearer to the horizontal.

Find the gradient of each line in grids a to d. By looking at the values you obtain, what do you think the gradient of a horizontal line is?

The line on grid e is vertical. The lines on grids a to d get nearer and nearer to the vertical.

Find the gradient of each line in grids a to d. By looking at the values you obtain, what do you think the gradient of a vertical line is?

**Gradient-intercept method for drawing graphs**

The ideas that you have discovered in the last activity lead to another way of plotting lines, known as the **gradient-intercept** method.

**EXAMPLE 4**

Draw the graph of \( y = 3x - 1 \), using the gradient-intercept method.

- Because the constant term is \( -1 \), we know that the graph goes through the y-axis at \( -1 \). We mark this point with a dot or a cross (A on diagram i).
- The number in front of \( x \) (called the **coefficient** of \( x \)) gives the relationship between \( y \) and \( x \). Because the coefficient of \( x \) is 3, this tells us that \( y \) is 3 times the \( x \) value, so the gradient of the line is 3. For an \( x \)-step of one unit, there is a \( y \)-step of three. Starting at \( -1 \) on the y-axis, we move one square across and three squares up and mark this point with a dot or a cross (B on diagram i).

Repeat this from every new point. You can also move one square back and three squares down. When enough points have been marked, join the dots (or crosses) to make the graph (diagram ii). Note that if the points are not in a straight line, a mistake has been made.

Draw these lines using the gradient-intercept method. Use the same grid, taking \( x \) from –10 to 10 and \( y \) from –10 to 10. If the grid gets too “crowded”, draw another one.

\[
\begin{align*}
\text{a} & : y = 2x + 6 \\
\text{b} & : y = 3x - 4 \\
\text{c} & : y = \frac{1}{2}x + 5 \\
\text{d} & : y = x + 7 \\
\text{e} & : y = 4x - 3 \\
\text{f} & : y = 2x - 7 \\
\text{g} & : y = \frac{1}{4}x - 3 \\
\text{h} & : y = \frac{2}{3}x + 4 \\
\text{i} & : y = 6x - 5 \\
\text{j} & : y = x + 8 \\
\text{k} & : y = \frac{4}{3}x - 2 \\
\text{l} & : y = 3x - 9
\end{align*}
\]

Using the gradient-intercept method, draw the following lines on the same grid. Use axes with ranges –6 \( \leq \) \( x \) \( \leq \) 6 and –8 \( \leq \) \( y \) \( \leq \) 8.

\[
\begin{align*}
\text{i} & : y = 3x + 1 \\
\text{ii} & : y = 2x + 3
\end{align*}
\]

b Where do the lines cross?

Using the gradient-intercept method, draw the following lines on the same grid. Use axes with ranges –14 \( \leq \) \( x \) \( \leq \) 4 and –2 \( \leq \) \( y \) \( \leq \) 6.

\[
\begin{align*}
\text{i} & : y = \frac{x}{3} + 3 \\
\text{ii} & : y = \frac{x}{4} + 2
\end{align*}
\]

b Where do the lines cross?

Using the gradient-intercept method draw the following lines on the same grid. Use axes with ranges –4 \( \leq \) \( x \) \( \leq \) 6 and –6 \( \leq \) \( y \) \( \leq \) 8.

\[
\begin{align*}
\text{i} & : y = x + 3 \\
\text{ii} & : y = 2x
\end{align*}
\]

b Where do the lines cross?

**Cover-up method for drawing graphs**

The \( x \)-axis has the equation \( y = 0 \). This means that all points on the \( x \)-axis have a \( y \)-value of 0.

The \( y \)-axis has the equation \( x = 0 \). This means that all points on the \( y \)-axis have an \( x \)-value of 0.

We can use these facts to draw any line that has an equation of the form:

\[ ax + by = c. \]
**EXAMPLE 5**

Draw the graph of $4x + 5y = 20$.

Because the value of $x$ is 0 on the $y$-axis, we can solve the equation for $y$:

$$4(0) + 5y = 20$$

$$5y = 20$$

$$\Rightarrow y = 4$$

Hence, the line passes through the point $(0, 4)$ on the $y$-axis (diagram A).

Because the value of $y$ is 0 on the $x$-axis, we can also solve the equation for $x$:

$$4x + 5(0) = 20$$

$$4x = 20$$

$$\Rightarrow x = 5$$

Hence, the line passes through the point $(5, 0)$ on the $x$-axis (diagram B). We need only two points to draw a line. (Normally, we would like a third point but in this case we can accept two.) The graph is drawn by joining the points $(0, 4)$ and $(5, 0)$ (diagram C).

This type of equation can be drawn very easily, without much working at all, using the cover-up method.

Start with the equation:

Cover up the $x$-term:

Solve the equation (when $x = 0$):

Now cover up the $y$-term:

Solve the equation (when $y = 0$):

This gives the points $(0, 4)$ on the $y$-axis and $(5, 0)$ on the $x$-axis.

**EXAMPLE 6**

Draw the graph of $2x - 3y = 12$.

Start with the equation:

Cover up the $x$-term:

Solve the equation (when $x = 0$):

Now cover up the $y$-term:

Solve the equation (when $y = 0$):

This gives the points $(0, -4)$ on the $y$-axis and $(6, 0)$ on the $x$-axis.
Draw these lines using the cover-up method. Use the same grid, taking \( x \) from –10 to 10 and \( y \) from –10 to 10. If the grid gets too “crowded”, draw another.

\[\begin{align*}
\text{a} & \quad 3x + 2y = 6 & \text{b} & \quad 4x + 3y = 12 & \text{c} & \quad 4x - 5y = 20 \\
\text{d} & \quad x + y = 10 & \text{e} & \quad 3x - 2y = 18 & \text{f} & \quad x - y = 4 \\
\text{g} & \quad 5x - 2y = 15 & \text{h} & \quad 2x - 3y = 15 & \text{i} & \quad 6x + 5y = 30 \\
\text{j} & \quad x + y = -5 & \text{k} & \quad x + y = 3 & \text{l} & \quad x - y = -4
\end{align*}\]

a Using the cover-up method, draw the following lines on the same grid. Use axes with ranges \(-2 \leq x \leq 6\) and \(-2 \leq y \leq 6\).

\[\begin{align*}
\text{i} & \quad 2x + y = 4 & \text{ii} & \quad x - 2y = 2
\end{align*}\]

b Where do the lines cross?

a Using the cover-up method, draw the following lines on the same grid. Use axes with ranges \(-2 \leq x \leq 6\) and \(-3 \leq y \leq 6\).

\[\begin{align*}
\text{i} & \quad x + 2y = 6 & \text{ii} & \quad 2x - y = 2
\end{align*}\]

b Where do the lines cross?

a Using the cover-up method, draw the following lines on the same grid. Use axes with ranges \(-6 \leq x \leq 8\) and \(-2 \leq y \leq 8\).

\[\begin{align*}
\text{i} & \quad x + y = 6 & \text{ii} & \quad x - y = 2
\end{align*}\]

b Where do the lines cross?

### 16.2 Finding the equation of a line from its graph

In this section you will learn how to:
- find the equation of a line using its gradient and intercept

#### The equation \( y = mx + c \)

When a graph can be expressed in the form \( y = mx + c \), the coefficient of \( x \), \( m \), is the gradient, and the constant term, \( c \), is the intercept on the \( y \)-axis.

This means that if we know the gradient, \( m \), of a line and its intercept, \( c \), on the \( y \)-axis, we can write down the equation of the line immediately.
For example, if \( m = 3 \) and \( c = -5 \), the equation of the line is \( y = 3x - 5 \).

All linear graphs can be expressed in the form \( y = mx + c \).

This gives us a method of finding the equation of any line drawn on a pair of coordinate axes.

**EXAMPLE 7**

Find the equation of the line shown in diagram A.

First, we find where the graph crosses the \( y \)-axis (diagram B).

So \( c = 2 \).

Next, we measure the gradient of the line (diagram C).

\[
\text{gradient} = \frac{\text{y-step}}{\text{x-step}} = \frac{8}{2} = 4
\]

So \( m = 4 \).

Finally, we write down the equation of the line: \( y = 4x + 2 \).

**EXERCISE 16E**

Give the equation of each of these lines, all of which have positive gradients. (Each square represents 1 unit.)
In each of these grids, there are two lines. (Each square represents 1 unit.)

For each grid:

i find the equation of each of the lines,

ii describe any symmetries that you can see,

iii what connection is there between the gradients of each pair of lines?

Give the equation of each of these lines, all of which have negative gradients. (Each square represents 1 unit.)

In each of these grids, there are three lines. One of them is \( y = x \). (Each square represents one unit.)

For each grid:

i find the equation of each of the other two lines,

ii describe any symmetries that you can see,

iii what connection is there between the gradients of each group of lines?
On page 310, you met two uses of graphs in kinematics, and the use of graphs to represent mortgage repayment and the rate of change of depth as a container is filled with water. Two other uses of graphs which we will now consider are finding formulae and solving simultaneous equations. Solving quadratic and other equations by graphical methods is covered in Chapter 17.

Finding formulae or rules

EXAMPLE 8

A taxi fare will cost more the further you go. The graph on the right illustrates the fares in one part of England.

The taxi company charges a basic hire fee to start with of £2.00. This is shown on the graph as the point where the line cuts through the hire-charge axis (when distance travelled is 0).

The gradient of the line is:

$$\frac{8 - 2}{4} = \frac{6}{4} = 1.5$$

This represents the hire charge per kilometre travelled.

So the total hire charge is made up of two parts: a basic hire charge of £2.00 and an additional charge of £1.50 per kilometre travelled. This can be put in a formula as

Hire charge = £2.00 + £1.50 per kilometre.

In this example, £2.00 is the constant term in the formula (the equation of the graph).
This graph is a conversion graph between °C and °F.

a How many °F are equivalent to a temperature of 0 °C?

b What is the gradient of the line?

c From your answers to parts a and b, write down a rule which can be used to convert °C to °F.

This graph illustrates charges for fuel.

a What is the gradient of the line?

b The standing charge is the basic charge before the cost per unit is added. What is the standing charge?

c Write down the rule used to work out the total charge for different amounts of units used.

This graph shows the hire charge for heaters over so many days.

a Calculate the gradient of the line.

b What is the basic charge before the daily hire charge is added on?

c Write down the rule used to work out the total hire charge.

This graph shows the hire charge for a conference centre depending on the number of people at the conference.

a Calculate the gradient of the line.

b What is the basic fee for hiring the conference centre?

c Write down the rule used to work out the total hire charge for the centre.
This graph shows the length of a spring when different weights are attached to it.

a Calculate the gradient of the line.

b How long is the spring when no weight is attached to it?

c By how much does the spring extend per kilogram?

d Write down the rule for finding the length of the spring for different weights.

Solving simultaneous equations

EXAMPLE 9

By drawing their graphs on the same grid, find the solution of these simultaneous equations.

a \(3x + y = 6\)  
b \(y = 4x - 1\)

a The first graph is drawn using the cover-up method. It crosses the \(x\)-axis at \((2, 0)\) and the \(y\)-axis at \((0, 6)\).

b This graph can be drawn by finding some points or by the gradient-intercept method. If you use the gradient-intercept method, you find the graph crosses the \(y\)-axis at \(-1\) and has a gradient of \(4\).

The point where the graphs intersect is \((1, 3)\). So the solution to the simultaneous equations is \(x = 1, y = 3\).

EXERCISE 16G

By drawing their graphs, find the solution of each of these pairs of simultaneous equations.

1. \(x + 4y = 8\)
   \(x - y = 3\)

2. \(y = 2x - 1\)
   \(3x + 2y = 12\)

3. \(y = 2x + 4\)
   \(y = x + 7\)

4. \(y = x\)
   \(x + y = 10\)

5. \(y = 2x + 3\)
   \(5x + y = 10\)

6. \(y = 5x + 1\)
   \(y = 2x + 10\)

7. \(y = x + 8\)
   \(x + y = 4\)

8. \(y - 3x = 9\)
   \(y = x - 3\)

9. \(y = -x\)
   \(y = 4x - 5\)

10. \(3x + 2y = 18\)
    \(y = 3x\)

11. \(y = 3x + 2\)
    \(y + x = 10\)

12. \(y = \frac{x}{3} + 1\)
    \(x + y = 11\)
EXAMPLE 10

In each of these grids, there are two lines.

For each grid:

i. find the equation of each line,

ii. describe the geometrical relationship between the lines,

iii. describe the numerical relationships between their gradients.

i. Grid a: the lines have equations $y = 2x + 1$, $y = -1/2x - 1$

Grid b: the lines have equations $y = \frac{3}{2}x - 2$, $y = -\frac{2}{3}x + 1$

Grid c: the lines have equations $y = \frac{1}{3}x$, $y = -\frac{5}{3}x - 2$

ii. In each case the lines are perpendicular (at right angles)

iii. In each case the gradients are reciprocals of each other but with different signs.

Note: If two lines are parallel, then their gradients are equal.

If two lines are perpendicular, their gradients are negative reciprocals of each other.
EXAMPLE 11

Find the line that is perpendicular to the line \( y = \frac{1}{2}x - 3 \) and passes through \((0, 5)\).
The gradient of the new line will be the negative reciprocal of \(\frac{1}{2}\) which is \(-2\).
The point \((0, 5)\) is the intercept on the \(y\)-axis so the equation of the line is \(y = -2x + 5\).

EXAMPLE 12

The point \(A\) is \((2, -1)\) and the point \(B\) is \((4, 5)\).

\(\text{a}\) Find the equation of the line parallel to \(AB\) and passing through \((2, 8)\).
\(\text{b}\) Find the equation of the line perpendicular to the midpoint of \(AB\).

\(\text{a}\) The gradient of \(AB\) is 3, so the new equation is of the form \(y = 3x + c\).

The new line passes through \((2, 8)\), so \(8 = 3 \times 2 + c \Rightarrow c = 2\)

Hence the line is \(y = 3x + 2\).

\(\text{b}\) The midpoint of \(AB\) is \((3, 2)\).
The gradient of the perpendicular line is the negative reciprocal of 3, which is \(-\frac{1}{3}\).

We could find \(c\) as in part \(\text{a}\) but we can also do a sketch on the grid. This will show that the perpendicular line passes through \((0, 3)\).

Hence the equation of the line is \(y = -\frac{1}{3}x + 3\).

EXERCISE 16H

1. Write down the negative reciprocals of the following numbers.

\(\text{a}\) 2 \hspace{1cm} \(\text{b}\) -3 \hspace{1cm} \(\text{c}\) 5 \hspace{1cm} \(\text{d}\) -1
\(\text{e}\) \(\frac{1}{2}\) \hspace{1cm} \(\text{f}\) \(\frac{1}{4}\) \hspace{1cm} \(\text{g}\) \(-\frac{1}{3}\) \hspace{1cm} \(\text{h}\) \(-\frac{1}{3}\)
\(\text{i}\) 1.5 \hspace{1cm} \(\text{j}\) 10 \hspace{1cm} \(\text{k}\) -6 \hspace{1cm} \(\text{l}\) \(\frac{1}{4}\)

2. Write down the equation of the line perpendicular to each of the following lines and which passes through the same point on the \(y\)-axis.

\(\text{a}\) \(y = 2x - 1\) \hspace{1cm} \(\text{b}\) \(y = -3x + 1\) \hspace{1cm} \(\text{c}\) \(y = x + 2\) \hspace{1cm} \(\text{d}\) \(y = -x + 2\)
\(\text{e}\) \(y = \frac{1}{2}x + 3\) \hspace{1cm} \(\text{f}\) \(y = \frac{1}{3}x - 3\) \hspace{1cm} \(\text{g}\) \(y = -\frac{1}{3}x\) \hspace{1cm} \(\text{h}\) \(y = -\frac{1}{3}x - 5\)
Write down the equations of these lines.

- parallel to \( y = 4x - 5 \) and passes through \((0, 1)\)
- parallel to \( y = \frac{1}{2}x + 3 \) and passes through \((0, -2)\)
- parallel to \( y = -x + 2 \) and passes through \((0, 3)\)

Write down the equations of these lines.

- perpendicular to \( y = 3x + 2 \) and passes through \((0, -1)\)
- perpendicular to \( y = \frac{1}{3}x - 2 \) and passes through \((0, 5)\)
- perpendicular to \( y = x - 5 \) and passes through \((0, 1)\)

A is the point \((1, 5)\). B is the point \((3, 3)\).

- Find the equation of the line parallel to \(AB\) and passing through \((5, 9)\).
- Find the equation of the line perpendicular to \(AB\) and passing through the midpoint of \(AB\).

Find the equation of the line that passes through the midpoint of \(AB\), where \(A\) is \((-5, -3)\) and \(B\) is \((-1, 3)\), and has a gradient of 2.

Find the equation of the line perpendicular to \(y = 4x - 3\), passing through \((-4, 3)\).

A is the point \((0, 6)\), B is the point \((5, 5)\) and C is the point \((4, 0)\).

- Write down the point where the line \(BC\) intercepts the \(y\)-axis.
- Work out the equation of the line \(AB\).
- Write down the equation of the line \(BC\).

Find the equation of the perpendicular bisector of the points \(A\) \((1, 2)\) and \(B\) \((3, 6)\).

A is the point \((0, 4)\), B is the point \((4, 6)\) and C is the point \((2, 0)\).

- Find the equation of the line \(BC\).
- Show that the point of intersection of the perpendicular bisectors of \(AB\) and \(AC\) is \((3, 3)\).
- Show algebraically that this point lies on the line \(BC\).
**EXAM QUESTIONS**

1. a. Draw the graph of \( y = 2x + 3 \) for values of \( x \) from 0 to 5. Use a grid with axes covering 0 ≤ \( x \) ≤ 6 and 0 ≤ \( y \) ≤ 14.
   b. Use your graph to solve 6.5 = 2\( x \) + 3.

2. The diagram shows a sketch of the graph of \( y = 3x + 1 \). Copy the diagram, and draw and label sketch graphs of these.
   a. \( y = 1 \)
   b. \( y = x + 1 \)

3. Here are five graphs labelled A, B, C, D and E.

   ![Graphs A, B, C, D, E](image)

   Each of the equations in the table represents one of the graphs A to E. Copy the table. Write the letter of each graph in the correct place in the table.

   **Edexcel, Question 3, Paper 10B Higher, March 2005**

4. Here are the equations of six lines.
   i. \( y = 2x + 1 \)  
   ii. \( y = \frac{1}{3}x - 3 \)  
   iii. \( y = \frac{1}{3}x - 1 \)  
   iv. \( y = 2x - 2 \)  
   v. \( y = 3x + 2 \)  
   vi. \( y = \frac{1}{3}x - 2 \)

   a. Which two lines are parallel?
   b. Which pairs of lines are perpendicular?
   c. Which two lines intersect on the y-axis?

5. The diagram shows three points A(–1, 5), B(2, –1) and C(0, 5). The line L is parallel to AB and passes through C.

   a. Find the equation of the line L.

6. a. Find the equation of the straight line which passes through the point (0, 3) and is perpendicular to the straight line with equation \( y = 2x \).
   b. The graphs of \( y = 2x^2 \) and \( y = mx - 2 \) intersect at the points A and B. The point B has coordinates (2, 8).

   ![Graphs](image)

   b. Find the coordinates of the point A.

   **Edexcel, Question 13, Paper 18 Higher, June 2003**

7. A is the point (5, 5). B is the point (3, 1). Find the equation of the line perpendicular to AB and passing through the midpoint of AB.

   ![Graphs](image)

   Find the equation of the line parallel to the line \( y = 3x + 5 \) passing through the point (2, 9).

8. Find the equation of the line parallel to the line \( y = 3x + 5 \) passing through the point (2, 9).

9. Find the equation of the perpendicular bisector of the line joining the two points A(4, 3) and B(8, 5).

10. A is the point (6, 3), B is the point (0, 5). Find algebraically, the point of intersection of the line perpendicular to AB passing through the midpoint and the line 2\( y + x = 4 \).

   ![Graphs](image)
**WORKED EXAM QUESTION**

a Find the equation of the line shown.

b Find the equation of the line perpendicular to the line shown and passing through (0, -5).

**Solution**

a Intercept is at (0, 5)

Gradient = \(-\frac{3}{6} = -\frac{1}{2}\)

Equation of the line is \(y = -\frac{1}{2}x + 5\)

First identify the point where the line crosses the \(y\)-axis. This is the intercept, \(c\).

Gradient of a perpendicular line is the negative reciprocal of \(-\frac{1}{2}\).

b Gradient is 2

Intercept is (0, -5)

Equation is \(y = 2x - 5\)

Intercept is given.

Put the two numbers into the equation \(y = mx + c\) to get the equation of the line.

Give equation in the form \(y = mx + c\).
**GRADE YOURSELF**

- Able to draw straight lines by plotting points
- Able to draw straight lines using the gradient-intercept method
- Able to solve a pair of linear simultaneous equations from their graphs
- Able to find the equations of linear graphs parallel and perpendicular to other linear graphs, that pass through specific points

**What you should know now**

- How to draw linear graphs
- How to solve simultaneous linear equations by finding the intersection point of the graphs of the equations or other related equations
- How to use gradients to find equations of parallel and perpendicular graphs
This chapter will show you ...

- how to draw quadratic, cubic, reciprocal and exponential graphs
- how to use graphs to find exact or approximate solutions to equations

What you should already know

- How to draw linear graphs
- How to find the equation of a graph using the gradient-intercept method

Quick check

1. Draw the graph of \( y = 3x - 1 \) for values of \( x \) from -2 to +3.
2. Give the equation of the graph shown.
17.1 Quadratic graphs

This section will show you how to:
● draw and read values from quadratic graphs

Key words
intercept
maximum
minimum
quadratic
roots
vertex

A quadratic graph has a term in $x^2$ in its equation. All of the following are quadratic equations and each would produce a quadratic graph.

\begin{align*}
 y &= x^2 \\
 y &= x^2 + 5 \\
 y &= x^2 - 3 \\
 y &= x^2 + 5x + 6 \\
 y &= 3x^2 - 5x + 4
\end{align*}

**EXAMPLE 1**

Draw the graph of $y = x^2 + 5x + 6$ for $-5 \leq x \leq 3$.

Make a table, as shown below. Work out each row ($x^2$, $5x$, 6) separately, adding them together to obtain the values of $y$. Then plot the points from the table.

<table>
<thead>
<tr>
<th>$x$</th>
<th>-5</th>
<th>-4</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>$x^2$</td>
<td>25</td>
<td>16</td>
<td>9</td>
<td>4</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>4</td>
<td>9</td>
</tr>
<tr>
<td>$5x$</td>
<td>-25</td>
<td>-20</td>
<td>-15</td>
<td>-10</td>
<td>-5</td>
<td>0</td>
<td>5</td>
<td>10</td>
<td>15</td>
</tr>
<tr>
<td>6</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td>6</td>
</tr>
<tr>
<td>$y$</td>
<td>6</td>
<td>2</td>
<td>0</td>
<td>2</td>
<td>6</td>
<td>12</td>
<td>20</td>
<td>30</td>
<td></td>
</tr>
</tbody>
</table>

Note that in an examination paper you may be given only the first and last rows, with some values filled in. For example,

<table>
<thead>
<tr>
<th>$x$</th>
<th>-5</th>
<th>-4</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td>6</td>
<td>2</td>
<td>0</td>
<td>2</td>
<td>6</td>
<td>12</td>
<td>20</td>
<td>30</td>
<td></td>
</tr>
</tbody>
</table>

In this case, you would either construct your own table, or work out the remaining $y$-values with a calculator.
**Example 2**

**a** Complete the table for \( y = 3x^2 - 5x + 4 \) for \(-1 \leq x \leq 3\), then draw the graph.

<table>
<thead>
<tr>
<th>x</th>
<th>-1</th>
<th>-0.5</th>
<th>0</th>
<th>0.5</th>
<th>1</th>
<th>1.5</th>
<th>2</th>
<th>2.5</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>12</td>
<td>2.25</td>
<td>2</td>
<td>2</td>
<td>10.25</td>
<td>16</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**b** Use your graph to find the value of \( y \) when \( x = 2.2 \).

**c** Use your graph to find the values of \( x \) that give a \( y \)-value of 9.

**Drawing accurate graphs**

Note that although it is difficult to draw accurate curves, examiners work to a tolerance of only 1 mm.

Here are some of the more common ways in which marks are lost in an examination (see also diagrams on the following page).

- When the points are too far apart, a curve tends to “wobble”.
- Drawing curves in small sections leads to “feathering”.
- The place where a curve should turn smoothly is drawn “flat”.
- A line is drawn through a point which, clearly, has been incorrectly plotted.
A quadratic curve drawn correctly will always give a smooth curve.

Here are some tips which will make it easier for you to draw smooth, curved lines.

- If you are right-handed, turn your piece of paper or your exercise book round so that you draw from left to right. Your hand is steadier this way than trying to draw from right to left or away from your body. If you are left-handed, you should find drawing from right to left the more accurate way.

- Move your pencil over the points as a practice run without drawing the curve.

- Do one continuous curve and only stop at a plotted point.

- Use a sharp pencil and do not press too heavily, so that you may easily rub out mistakes.

Normally in an examination, grids are provided with the axes clearly marked. This is so that the examiner can place a transparent master over a graph and see immediately whether any lines are badly drawn or points are misplotted. Remember that a tolerance of 1 mm is all that you are allowed. In the exercises below, suitable ranges are suggested for the axes. You can use any type of graph paper to draw the graphs.

Also you do not need to work out all values in a table. If you use a calculator, you need only to work out the y-value. The other rows in the table are just working lines to break down the calculation.

**EXERCISE 17A**

<table>
<thead>
<tr>
<th>x</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>

b Where does the graph cross the \( x \)-axis?

The significant points of a quadratic graph

A quadratic graph has four points that are of interest to a mathematician. These are the points A, B, C and D on the diagram. A and B are called the roots, and are where the graph crosses the \( x \)-axis, C is the point where the graph crosses the \( y \)-axis (the intercept) and D is the vertex, and is the lowest or highest point of the graph.

The roots

If you look at your answer to question 7 in Exercise 17A, you will see that the graph crosses the \( x \)-axis at \( x = -0.5 \) and \( x = 3 \). Since the \( x \)-axis is the line \( y = 0 \), the \( y \)-value at any point on the \( x \)-axis is zero. So, you have found the solution to the equation

\[
0 = 2x^2 - 5x - 3 \quad \text{that is} \quad 2x^2 - 5x - 3 = 0
\]

You met equations of this type in Chapter 12. They are known as quadratic equations.

You solved them either by factorisation or by using the quadratic formula. That is, you found the values of \( x \) that made them true. Such values are called the roots of an equation. So in the case of the quadratic equation \( 2x^2 - 5x - 3 = 0 \), its roots are -0.5 and 3.

Let’s check these values:

For \( x = 3.0 \) \[ 2(3)^2 - 5(3) - 3 = 18 - 15 - 3 = 0 \]

For \( x = 0.5 \) \[ 2(-0.5)^2 - 5(-0.5) - 3 = 0.5 + 2.5 - 3 = 0 \]

We can find the roots of a quadratic equation by drawing its graph and finding where the graph crosses the \( x \)-axis.
The $y$-intercept

If you look at all the quadratic graphs we have drawn so far you will see a connection between the equation and the point where the graph crosses the $y$-axis. Very simply, the constant term of the equation $y = ax^2 + bx + c$ (that is, the value $c$) is where the graph crosses the $y$-axis. The intercept is at $(0, c)$.

The vertex

The lowest (or highest) point of a quadratic graph is called the vertex.

If it is the highest point, it is called the maximum.

If it is the lowest point, it is called the minimum.

It is difficult to find a general rule for the point, but the $x$-coordinate is always half-way between the roots.

The easiest way to find the $y$-value is to substitute the $x$-value into the original equation.

Another way to find the vertex is to use completing the square (see section 12.5, page 293).
CHAPTER 17: MORE GRAPHS AND EQUATIONS

EXAMPLE 4

a Write the equation \( x^2 - 3x - 4 = 0 \) in the form \((x - p)^2 - q = 0\).
b What is the least value of the graph \( y = x^2 - 3x - 4 \)?

\[ a \quad x^2 - 3x - 4 = (x - 1)^2 - 2 - 4 \]
\[ = (x - 1)^2 - 6 \]

b Looking at the graph drawn in Example 3 you can see that the minimum point is at \((1, -6)\), so the least value is \(-6\).

You should be able to see the connection between the vertex point and the equation written in completing the square form.

As a general rule when a quadratic is written in the form \((x - p)^2 + q\) then the minimum point is \((p, q)\). Note the sign change of \(p\).

Note: If the \(x^2\) term is negative then the graph will be inverted and the vertex will be a maximum.

EXERCISE 17B

a Copy and complete the table to draw the graph of \( y = x^2 - 4 \) for \(-4 \leq x \leq 4\).

<table>
<thead>
<tr>
<th>x</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>5</td>
<td>6</td>
<td>7</td>
<td>6</td>
<td>5</td>
</tr>
</tbody>
</table>

b Use your graph to find the roots of \( x^2 - 4 = 0 \).

c Copy and complete the table to draw the graph of \( y = x^2 - 9 \) for \(-4 \leq x \leq 4\).

<table>
<thead>
<tr>
<th>x</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>9</td>
<td>6</td>
<td>1</td>
<td>-4</td>
<td>-9</td>
</tr>
</tbody>
</table>

b Use your graph to find the roots of \( x^2 - 9 = 0 \).

d Look at the equations of the graphs you drew in questions 1 and 2. Is there a connection between the numbers in each equation and its roots?

b Before you draw the graphs in parts c and d, try to predict what their roots will be (\( \sqrt{5} \approx 2.2\)).

e Copy and complete the table to draw the graph of \( y = x^2 - 1 \) for \(-4 \leq x \leq 4\).

<table>
<thead>
<tr>
<th>x</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>6</td>
<td>7</td>
<td>6</td>
<td>5</td>
<td>4</td>
</tr>
</tbody>
</table>
Copy and complete the table to draw the graph of \( y = x^2 - 5 \) for \(-4 \leq x \leq 4\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-4</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>11</td>
<td>-1</td>
<td></td>
<td></td>
<td>4</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Were your predictions correct?

Copy and complete the table to draw the graph of \( y = x^2 + 4x \) for \(-5 \leq x \leq 2\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-5</th>
<th>-4</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( x^2 )</td>
<td>25</td>
<td>16</td>
<td>4</td>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>( +4x )</td>
<td>-20</td>
<td>-8</td>
<td>4</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>( y )</td>
<td>5</td>
<td>-4</td>
<td>5</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use your graph to find the roots of the equation \( x^2 + 4x = 0 \).

Copy and complete the table to draw the graph of \( y = x^2 - 6x \) for \(-2 \leq x \leq 8\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>( x^2 )</td>
<td>4</td>
<td>1</td>
<td></td>
<td>16</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>( -6x )</td>
<td>12</td>
<td>-6</td>
<td></td>
<td>-24</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>( y )</td>
<td>16</td>
<td>-5</td>
<td></td>
<td>-8</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use your graph to find the roots of the equation \( x^2 - 6x = 0 \).

Copy and complete the table to draw the graph of \( y = x^2 + 3x \) for \(-5 \leq x \leq 3\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-5</th>
<th>-4</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>10</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>10</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use your graph to find the roots of the equation \( x^2 + 3x = 0 \).

Look at the equations of the graphs you drew in questions 4, 5 and 6. Is there a connection between the numbers in each equation and the roots?

Before you draw the graphs in parts c and d, try to predict what their roots will be.

Copy and complete the table to draw the graph of \( y = x^2 - 3x \) for \(-2 \leq x \leq 5\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>10</td>
<td></td>
<td></td>
<td>10</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Copy and complete the table to draw the graph of \( y = x^2 + 5x \) for \(-6 \leq x \leq 2\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-6</th>
<th>-5</th>
<th>-4</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>6</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>6</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Were your predictions correct?
For questions 1 to 7 write down the following.

- the point of intersection of the graph with the y-axis
- the coordinates of the minimum point (vertex) of each graph
- Explain the connection between these points and the original equation.

8. a Copy and complete the table to draw the graph of \( y = x^2 - 4x + 4 \) for \(-1 \leq x \leq 5\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>9</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

b Use your graph to find the roots of the equation \( x^2 - 4x + 4 = 0 \).

- What happens with the roots?

9. a Copy and complete the table to draw the graph of \( y = x^2 - 6x + 3 \) for \(-1 \leq x \leq 7\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>10</td>
<td>-5</td>
<td>-2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

b Use your graph to find the roots of the equation \( x^2 - 6x + 3 = 0 \).

10. a Copy and complete the table to draw the graph of \( y = 2x^2 + 5x - 6 \) for \(-5 \leq x \leq 2\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-5</th>
<th>-4</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

b Use your graph to find the roots of the equation \( 2x^2 + 5x - 6 = 0 \).

11. a Write the equation \( y = x^2 - 4x + 4 \) in the form \( y = (x - p)^2 + q \).

b Write down the minimum value of the equation \( y = x^2 - 4x + 4 \).

12. a Write the equation \( y = x^2 - 6x + 3 \) in the form \( y = (x - p)^2 + q \).

b Write down the minimum value of the equation \( y = x^2 - 6x + 3 \).

13. a Write the equation \( y = x^2 - 8x + 2 \) in the form \( y = (x - p)^2 + q \).

b Write down the minimum value of the equation \( y = x^2 - 8x + 2 \).

14. a Write the equation \( y = -x^2 + 2x - 6 \) in the form \( y = -(x - p)^2 + q \).

b Write down the minimum value of the equation \( y = -x^2 + 2x - 6 \).
17.2 Other graphs

This section will show you how to:

- recognise important graphs that you will meet in higher GCSE

Key words

asymptote
cosine
cubic
exponential
d Roosevelt functions
reciprocal
sine
square root

Square-root graphs

The graph of \( y^2 = x \) is one you should be able to recognise and draw.

When you are working out coordinates in order to plot \( y = \sqrt{x} \), remember that for every value of \( x \) (except \( x = 0 \)) there are two square roots, one positive and the other negative, which give pairs of coordinates. For example,

- when \( x = 1 \), \( y = \pm 1 \) giving coordinates \((1, -1)\) and \((1, 1)\)
- when \( x = 4 \), \( y = \pm 2 \) giving coordinates \((4, -2)\) and \((4, 2)\)

In the case of \( x = 0 \), \( y = 0 \) and so there is only one coordinate: \((0, 0)\).

Using these five points, you can draw the graph.

![Graph](image)

Reciprocal graphs

A reciprocal equation has the form \( y = \frac{a}{x} \).

Examples of reciprocal equations are:

\[
\begin{align*}
  y &= \frac{1}{x} \\
  y &= \frac{4}{x} \\
  y &= -\frac{3}{x}
\end{align*}
\]

All reciprocal graphs have a similar shape and some symmetry properties.
EXAMPLE 5

Complete the table to draw the graph of $y = \frac{1}{x}$ for $-4 \leq x \leq 4$.

<table>
<thead>
<tr>
<th>$x$</th>
<th>-4</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Values are rounded off to two decimal places, as it is unlikely that you could plot a value more accurately than this. The completed table is

<table>
<thead>
<tr>
<th>$x$</th>
<th>-4</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td>-0.25</td>
<td>-0.33</td>
<td>-0.5</td>
<td>-1</td>
<td>1</td>
<td>0.5</td>
<td>0.33</td>
<td>0.25</td>
</tr>
</tbody>
</table>

The graph plotted from these values is shown in A. This is not much of a graph and does not show the properties of the reciprocal function. If we take $x$-values from -0.8 to 0.8 in steps of 0.2, we get the next table.

Note that we cannot use $x = 0$ since $\frac{1}{0}$ is infinity.

<table>
<thead>
<tr>
<th>$x$</th>
<th>-0.8</th>
<th>-0.6</th>
<th>-0.4</th>
<th>-0.2</th>
<th>0.2</th>
<th>0.4</th>
<th>0.6</th>
<th>0.8</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td>-1.25</td>
<td>-1.67</td>
<td>-2.5</td>
<td>-5</td>
<td>5</td>
<td>2.5</td>
<td>1.67</td>
<td>1.25</td>
</tr>
</tbody>
</table>

Plotting these points as well gives the graph in B.

From the graph in B, the following properties can be seen.
- The lines $y = x$ and $y = -x$ are lines of symmetry.
- The closer $x$ gets to zero, the nearer the graph gets to the $y$-axis.
- As $x$ increases, the graph gets closer to the $x$-axis.

The graph never actually touches the axes, it just gets closer and closer to them. A line to which a graph gets closer but never touches or crosses is called an asymptote.

These properties are true for all reciprocal graphs.
EXERCISE 17C

1. a. Copy and complete the table to draw the graph of \( y = \frac{2}{x} \) for \(-4 \leq x \leq 4\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>0.2</th>
<th>0.4</th>
<th>0.5</th>
<th>0.8</th>
<th>1.5</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>10</td>
<td>4</td>
<td>2.5</td>
<td>1</td>
<td>1</td>
<td>0.5</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

b. Use your graph to find the following.

i. the \( y \)-value when \( x = 2.5 \)

ii. the \( x \)-value when \( y = 1.25 \)

2. a. Copy and complete the table to draw the graph of \( y^2 = 25x \) for \( 0 \leq x \leq 5 \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>( \sqrt{x} )</th>
<th>( y = 5\sqrt{x} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>5</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>10</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>15</td>
</tr>
<tr>
<td>4</td>
<td>2 and -2</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>5</td>
<td></td>
</tr>
</tbody>
</table>

b. Use your graph to find the following.

i. the values of \( y \) when \( x = 3.5 \)

ii. the value of \( x \) when \( y = 8 \)

3. a. Copy and complete the table to draw the graph of \( 4y^2 = x \) for \( 0 \leq x \leq 5 \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>( \sqrt{x} )</th>
<th>( y = \frac{1}{2}\sqrt{x} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0.5</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>1.5</td>
</tr>
<tr>
<td>4</td>
<td>2 and -2</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>5</td>
<td></td>
</tr>
</tbody>
</table>

b. Use your graph to find the following.

i. the values of \( y \) when \( x = 2.5 \)

ii. the value of \( x \) when \( y = 0.75 \)

4. a. Copy and complete the table to draw the graph of \( y = \frac{1}{x} \) for \(-5 \leq x \leq 5 \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>0.1</th>
<th>0.2</th>
<th>0.4</th>
<th>0.5</th>
<th>1</th>
<th>2</th>
<th>2.5</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>10</td>
<td>2.5</td>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>0.2</td>
</tr>
</tbody>
</table>

b. On the same axes, draw the line \( x + y = 5 \).

c. Use your graph to find the \( x \)-values of the points where the graphs cross.

5. a. Copy and complete the table to draw the graph of \( y = \frac{5}{x} \) for \(-20 \leq x \leq 20 \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>0.2</th>
<th>0.4</th>
<th>0.5</th>
<th>1</th>
<th>2</th>
<th>5</th>
<th>10</th>
<th>15</th>
<th>20</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>25</td>
<td>10</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>0.25</td>
</tr>
</tbody>
</table>

b. On the same axes, draw the line \( y = x + 10 \).

c. Use your graph to find the \( x \)-values of the points where the graphs cross.
**Cubic graphs**

A cubic function or graph is one which contains a term in $x^3$. The following are examples of cubic graphs:

- $y = x^3$
- $y = x^3 - 2x^2 - 3x - 4$
- $y = x^3 - x^2 - 4x + 4$
- $y = x^3 + 3x$

The techniques used to draw them are exactly the same as those for quadratic and reciprocal graphs.

**EXAMPLE 6**

**a** Complete the table to draw the graph of $y = x^3 - x^2 - 4x + 4$ for $-3 \leq x \leq 3$.

<table>
<thead>
<tr>
<th>$x$</th>
<th>-3</th>
<th>-2.5</th>
<th>-2</th>
<th>-1</th>
<th>-0.5</th>
<th>0</th>
<th>0.5</th>
<th>1</th>
<th>1.5</th>
<th>2</th>
<th>2.5</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td>-20.00</td>
<td>0.00</td>
<td>6.00</td>
<td>4.00</td>
<td>1.88</td>
<td>3.38</td>
<td>10.00</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**b** By drawing a suitable line on the graph find the solution of the equation $x^3 - x^2 - 4x - 1 = 0$.

**a** The completed table (to 2 decimal places) is given below and the graph is shown below right.

<table>
<thead>
<tr>
<th>$x$</th>
<th>-3</th>
<th>-2.5</th>
<th>-2</th>
<th>-1</th>
<th>-0.5</th>
<th>0</th>
<th>0.5</th>
<th>0.5</th>
<th>1</th>
<th>1.5</th>
<th>2</th>
<th>2.5</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td>-20.00</td>
<td>-7.88</td>
<td>0.00</td>
<td>4.38</td>
<td>6.00</td>
<td>5.63</td>
<td>4.00</td>
<td>1.88</td>
<td>0.00</td>
<td>-0.88</td>
<td>0.00</td>
<td>3.38</td>
<td>10.00</td>
</tr>
</tbody>
</table>

**b** Can you see the similarity between the equation of the graph, $y = x^3 - x^2 - 4x + 4$, and the equation to be solved, $x^3 - x^2 - 4x - 1 = 0$?

Rearrange the equation to be solved as $x^3 - x^2 - 4x + 4 = 0$. That is, make the left-hand side of the equation to be solved the same as the right-hand side of the equation of the graph. You can do this by adding 5 to the $-1$ to make $+4$. So add 5 to both sides of the equation to be solved:

- $x^3 - x^2 - 4x - 5 = 0$
- $x^3 - x^2 - 4x + 4 = 5$

Hence, you simply need to draw the straight line $y = 5$ and find the $x$-coordinates of the points where it crosses $y = x^3 - x^2 - 4x + 4$.

The solutions can now be read from the graph as $x = -1.4, -0.3$ and 2.7.
Copy and complete the table to draw the graph of \( y = x^3 + 3 \) for \(-3 \leq x \leq 3\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-3</th>
<th>-2</th>
<th>-1.5</th>
<th>-1</th>
<th>-0.5</th>
<th>0</th>
<th>0.5</th>
<th>1</th>
<th>1.5</th>
<th>2</th>
<th>2.5</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>-27.00</td>
<td>-8.00</td>
<td>3.38</td>
<td>-1.00</td>
<td>0.00</td>
<td>-0.13</td>
<td>0.5</td>
<td>1.63</td>
<td>2.31</td>
<td>23.13</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use your graph to find the \( y \)-value for an \( x \)-value of 1.2.

Copy and complete the table to draw the graph of \( y = 2x^3 \) for \(-3 \leq x \leq 3\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-3</th>
<th>-2</th>
<th>-1.5</th>
<th>-1</th>
<th>-0.5</th>
<th>0</th>
<th>0.5</th>
<th>1</th>
<th>1.5</th>
<th>2</th>
<th>2.5</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>-31.25</td>
<td>-6.75</td>
<td>0.00</td>
<td>0.25</td>
<td>16.00</td>
<td>1</td>
<td>1.5</td>
<td>2</td>
<td>2.5</td>
<td>3</td>
<td>1.2</td>
<td>1</td>
</tr>
</tbody>
</table>

Use your graph to find the \( y \)-value for an \( x \)-value of 2.7.

Copy and complete the table to draw the graph of \( y = -x^3 \) for \(-3 \leq x \leq 3\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-3</th>
<th>-2</th>
<th>-1.5</th>
<th>-1</th>
<th>-0.5</th>
<th>0</th>
<th>0.5</th>
<th>1</th>
<th>1.5</th>
<th>2</th>
<th>2.5</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>27.00</td>
<td>8.00</td>
<td>3.38</td>
<td>1.00</td>
<td>0.13</td>
<td>8.00</td>
<td>-15.63</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use your graph to find the \( y \)-value for an \( x \)-value of -0.6.

Copy and complete the table to draw the graph of \( y = x^3 + 3x \) for \(-3 \leq x \leq 3\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-3</th>
<th>-2</th>
<th>-1.5</th>
<th>-1</th>
<th>-0.5</th>
<th>0</th>
<th>0.5</th>
<th>1</th>
<th>1.5</th>
<th>2</th>
<th>2.5</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>-36.00</td>
<td>-14.00</td>
<td>-7.88</td>
<td>0.00</td>
<td>1.63</td>
<td>23.13</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use your graph to find the \( x \)-value for a \( y \)-value of 2.

Copy and complete the table to draw the graph of \( y = x^3 - 3x^2 - 3x \) for \(-3 \leq x \leq 3\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-3</th>
<th>-2</th>
<th>-1.5</th>
<th>-1</th>
<th>-0.5</th>
<th>0</th>
<th>0.5</th>
<th>1</th>
<th>1.5</th>
<th>2</th>
<th>2.5</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td>-45.00</td>
<td>-14.00</td>

b On the same axes, draw the graph of \( y = x \).

c Use your graph to find the \( x \)-values of the points where the graphs cross.

d Write down whether each of these graphs are “linear”, “quadratic”, “reciprocal”, “cubic” or “none of these”.

[Diagrams of graphs a to i]
Exponential graphs

Equations which have the form \(y = k^x\), where \(k\) is a positive number, are called exponential functions.

Exponential functions share the following properties.

- When \(k\) is greater than 1, the value of \(y\) increases steeply as \(x\) increases, which you can see from the graph on the right.

- Also when \(k\) is greater than 1, as \(x\) takes on increasingly large negative values, the closer \(y\) gets to zero, and so the graph gets nearer and nearer to the negative \(x\)-axis. \(y\) never actually becomes zero and so the graph never actually touches the negative \(x\)-axis. That is, the negative \(x\)-axis is an asymptote to the graph. (See also page 396.)

- Whatever the value of \(k\), the graph always intercepts the \(y\)-axis at 1, because here \(y = k^0\).

- The reciprocal graph, \(y = k^{-x}\), is the reflection in the \(y\)-axis of the graph of \(y = k^x\), as you can see from the graph (on the right).

**EXAMPLE 7**

\(\text{a} \quad \text{Complete the table below for } y = 2^x \text{ for values of } x \text{ from } -5 \text{ to } +5. (\text{Values are rounded to 2 decimal places.})\)

Write down a rule for the number of pieces after \( n \) tears.

How many pieces will there be piled up after 50 tears?

How thick is this pile?

The circular function graphs

You saw the graphs of \( y = \sin x \) and \( y = \cos x \) in Chapter 15.

These graphs have some special properties.

- They are cyclic. This means that they repeat indefinitely in both directions.
- For every value of sine or cosine between \(-1\) and \(1\) there are 2 angles between \(0^\circ\) and \(360^\circ\), and an infinite number of angles altogether.
- The sine graph has rotational symmetry about \((180^\circ, 0)\) and has line symmetry between \(0^\circ\) and \(180^\circ\) about \(x = 90^\circ\), and between \(180^\circ\) and \(360^\circ\) about \(x = 270^\circ\).
- The cosine graph has line symmetry about \(x = 180^\circ\), and has rotational symmetry between \(0^\circ\) and \(180^\circ\) about \((90^\circ, 0)\) and between \(180^\circ\) and \(360^\circ\) about \((270^\circ, 0)\).

The graphs can be used to find angles with certain values of sine and cosine.
EXAMPLE 8

Given that \( \sin 42^\circ = 0.669 \), find another angle between \( 0^\circ \) and \( 360^\circ \) that also has a sine of 0.669.

Plot the approximate value 0.669 on the sine graph and use the symmetry to work out the other value.

The other value is \( 180^\circ - 42^\circ = 138^\circ \).

EXAMPLE 9

Given that \( \cos 110^\circ = -0.342 \), find two angles between \( 0^\circ \) and \( 360^\circ \) that have a cosine of \( +0.342 \).

Plot the approximate values \(-0.342\) and 0.342 on the cosine graph and use the symmetry to work out the values.

The required values are \( 90^\circ - 20^\circ = 70^\circ \) and \( 270^\circ + 20^\circ = 290^\circ \).
Given that \( \sin 65^\circ = 0.906 \), find another angle between 0° and 360° that also has a sine of 0.906.

Given that \( \sin 213^\circ = -0.545 \), find another angle between 0° and 360° that also has a sine of -0.545.

Given that \( \cos 36^\circ = 0.809 \), find another angle between 0° and 360° that also has a cosine of 0.809.

Given that \( \cos 165^\circ = -0.966 \), find another angle between 0° and 360° that also has a cosine of -0.966.

Given that \( \sin 30^\circ = 0.5 \), find two angles between 0° and 360° that have a sine of -0.5.

Given that \( \cos 45^\circ = 0.707 \), find two angles between 0° and 360° that have a cosine of -0.707.

Given that \( \sin 26^\circ = 0.438 \)

\( a \) write down an angle between 0° and 90° that has a cosine of 0.438,

\( b \) find two angles between 0° and 360° that have a sine of -0.438,

\( c \) find two angles between 0° and 360° that have a cosine of -0.438.

Many equations can be solved by drawing two intersecting graphs on the same axes and using the x-value(s) of their point(s) of intersection. (In the GCSE examination, you are very likely to be presented with one drawn graph and asked to draw a straight line to solve a new equation.)

**EXAMPLE 10**

Show how each equation given below can be solved using the graph of \( y = x^3 - 2x - 2 \) and its intersection with another graph. In each case, give the equation of the other graph and the solution(s).

\( a \) \( x^3 - 2x - 4 = 0 \)

\( b \) \( x^3 - 3x - 1 = 0 \)

\( a \) This method will give the required graph.

Step 1: Write down the original (given) equation.

\( y = x^3 - 2x - 2 \)

Step 2: Write down the (new) equation to be solved in reverse.

\( O = x^3 - 2x - 4 \)

Step 3: Subtract these equations.

\( y = + 2 \)

Step 4: Draw this line on the original graph to solve the new equation.
The graphs of \( y = x^3 - 2x - 2 \) and \( y = 2 \) are drawn on the same axes.

The intersection of these two graphs is the solution of \( x^3 - 2x - 4 = 0 \).

The solution is \( x = 2 \).

This works because you are drawing a straight line along with the original graph, and solving where they intersect.

At the points of intersection you can say:

original equation = straight line

Rearranging this gives:

\( \text{(original equation)} - \text{(straight line)} = 0 \)

You have been asked to solve:

\( \text{(new equation)} = 0 \)

So \( \text{(original equation)} - \text{(straight line)} = \text{(new equation)} \)

Rearranging this again gives:

\( \text{(original equation)} - \text{(new equation)} = \text{straight line} \)

Note: In GCSE exams the curve is always drawn already and you will only have to draw the straight line.

b Write down given graph:

\[ y = x^3 - 2x - 2 \]

Write down new equation:

\[ 0 = x^3 - 3x - 1 \]

Subtract:

\[ y = x - 1 \]

The graphs of \( y = x^3 - 2x - 2 \) and \( y = x - 1 \) are then drawn on the same axes.

The intersection of the two graphs is the solution of \( x^3 - 3x - 1 = 0 \).

The solutions are \( x = -1.5, -0.3 \) and 1.9.
In questions 1 to 5, use the graphs given here. Trace the graphs or place a ruler over them in the position of the line. Solution values only need to be given to 1 decimal place. In questions 6 to 10, either draw the graphs yourself or use a graphics calculator to draw them.

On the following page is the graph of \( y = x^2 - 3x - 6 \).

\[ a \quad x^2 - 3x - 6 = 0 \]
\[ b \quad x^2 - 3x - 6 = 4 \]
\[ c \quad x^2 - 3x - 2 = 0 \]
b By drawing a suitable straight line solve \(2x^2 - 6x + 2 = 0\).

Below is the graph of \(y = x^2 + 4x - 5\).

a Solve \(x^2 + 4x - 5 = 0\).

b By drawing suitable straight lines solve these equations.

i \(x^2 + 4x - 5 = 2\)

ii \(x^2 + 4x - 4 = 0\)

iii \(3x^2 + 12x + 6 = 0\)
Below are the graphs of $y = x^2 - 5x + 3$ and $y = x + 3$.

**a** Solve these equations.  
  i. $x^2 - 6x = 0$  
  ii. $x^2 - 5x + 3 = 0$

**b** By drawing suitable straight lines solve these equations.  
  i. $x^2 - 5x + 3 = 2$  
  ii. $x^2 - 5x - 2 = 0$

Below are the graphs of $y = x^2 - 2$ and $y = x + 2$.

**a** Solve these equations.  
  i. $x^2 - x - 4 = 0$  
  ii. $x^2 - 2 = 0$

**b** By drawing suitable straight lines solve these equations.  
  i. $x^2 - 2 = 3$  
  ii. $x^2 - 4 = 0$
Below are the graphs of \( y = x^3 - 2x^2 \), \( y = 2x + 1 \) and \( y = x - 1 \).

Solve these equations.

\[ \begin{align*}
  a) & \quad x^3 - 2x^2 = 0 \\
  b) & \quad x^3 - 2x^2 = 3 \\
  c) & \quad x^3 - 2x^2 + 1 = 0 \\
  d) & \quad x^3 - 2x^2 - 2x - 1 = 0 \\
  e) & \quad x^3 - 2x^2 - x + 1 = 0
\end{align*} \]

Draw the graph of \( y = x^2 - 4x - 2 \).

\[ \begin{align*}
  a) & \quad \text{Solve } x^2 - 4x - 2 = 0. \\
  b) & \quad \text{By drawing a suitable straight line solve } x^2 - 4x - 5 = 0.
\end{align*} \]

Draw the graph of \( y = 2x^2 - 5 \).

\[ \begin{align*}
  a) & \quad \text{Solve } 2x^2 - 5 = 0. \\
  b) & \quad \text{By drawing a suitable straight line solve } 2x^2 - 3 = 0.
\end{align*} \]

Draw the graphs of \( y = x^2 - 3 \) and \( y = x + 2 \) on the same axes. Use the graphs to solve these equations.

\[ \begin{align*}
  a) & \quad x^2 - 5 = 0 \\
  b) & \quad x^2 - x - 5 = 0
\end{align*} \]

Draw the graphs of \( y = x^2 - 3x - 2 \) and \( y = 2x - 3 \) on the same axes. Use the graphs to solve these equations.

\[ \begin{align*}
  a) & \quad x^2 - 3x - 1 = 0 \\
  b) & \quad x^2 - 5x + 1 = 0
\end{align*} \]

Draw the graphs of \( y = x^2 - 2x^2 + 3x - 4 \) and \( y = 3x - 1 \) on the same axes. Use the graphs to solve these equations.

\[ \begin{align*}
  a) & \quad x^3 - 2x^2 + 3x - 6 = 0 \\
  b) & \quad x^3 - 2x^2 - 3 = 0
\end{align*} \]
a Complete the table of values for \( y = x^2 - 3x - 1 \).

b Draw the graph of \( y = (x + 3)(2 - x) \) for values of \( x \) from \(-3 \) to \( 3 \). Use a grid with an \( x \)-axis from \(-4 \) to \( 4 \) and a \( y \)-axis from \(-8 \) to \( 8 \).
c Use the graph to solve the equation \( (x + 3)(2 - x) = 2 \).

Edexcel, Question 5, Paper 10B Higher, January 2004

Here is a sketch of the graph of \( y = 25 - \frac{(x - 8)^2}{4} \) for \( 0 \leq x \leq 12 \).

\( P \) and \( Q \) are points on the graph. \( P \) is the point at which the graph meets the \( y \)-axis. \( Q \) is the point at which \( y \) has its maximum value.

a Find the coordinates of
i \( P \)
ii \( Q \)

b Show that \( 25 - \frac{(x - 8)^2}{4} = \frac{(2 + x)(18 - x)}{4} \)

Edexcel, Question 10, Paper 18 Higher, June 2005

a Complete the table of values for \( y = (0.7)^x \)

<table>
<thead>
<tr>
<th>( x )</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>

<td>0.06</td>
</tr>
</tbody>
</table>

b Draw the graph of \( y = (0.7)^x \) for values of \( x \) from \( 0 \) to \( 4 \). Use a grid with an \( x \)-axis from \( 0 \) to \( 5 \) and a \( y \)-axis from \( 0 \) to \( 1 \), marked off every 0.1 units.
c Use your graph to solve the equation \( (0.7)^x = 0.6 \)
WORKED EXAM QUESTION

The diagram right shows the graph of
\[ y = x^3 - 12x \]
for values of \( x \) from -4 to 4.

a Use the graph to find estimates of the three solutions of the equation
\[ x^3 - 12x = 0 \]
These are the roots of the equation.

b By drawing a suitable straight line on the grid, find estimates of the solutions of the equation
\[ x^3 - 12x - 5 = 0 \]
Label clearly the straight line that you have drawn.

c By drawing a suitable straight line on the grid, find estimates of the solutions of the equation
\[ x^3 - 14x + 5 = 0 \]
Label clearly the straight line that you have drawn.

Solution

\( a \) \(-3.5, 0 \) and 3.5

To find the values where the given graph is equal to zero read from the \( x \)-axis. These are the roots of the equation.

\( b \) \(-3.3, -0.5, 3.7\)

To find the straight line subtract the required curve from the given curve.

- Given curve \( y = x^3 - 12x \)
- New curve \( 0 = x^3 - 12x - 5 \)
- Subtract \( y = 5 \)
- Draw \( y = 5 \)

\( c \) \(-3.9, 0.4, 3.5\)

To find the straight line subtract the required curve from the given curve.

- Given curve \( y = x^3 - 12x \)
- New curve \( 0 = x^3 - 14x + 5 \)
- Subtract \( y = 2x - 5 \)
- Draw \( y = 2x - 5 \)
GRADE YOURSELF

- Able to draw quadratic graphs using a table of values
- Able to solve quadratic equations from their graphs
- Plot cubic graphs using a table of values
- Recognise the shapes of the graphs $y = x^3$ and $y = \frac{1}{x}$
- Able to draw a variety of graphs such as exponential graphs and reciprocal graphs using a table of values
- Able to solve equations using the intersection of two graphs
- Use trigonometric graphs to solve sine and cosine problems

What you should know now

- How to draw non-linear graphs
- How to solve equations by finding the intersection points of the graphs of the equations with the $x$-axis or other related equations
This chapter will show you ...
- how to interpret and draw line graphs and stem-and-leaf diagrams
- how to draw scatter diagrams and lines of best fit
- how to interpret scatter diagrams and the different types of correlation
- how to draw and interpret cumulative frequency diagrams
- how to draw and interpret box plots
- how to calculate the standard deviation of a set of data

Visual overview

What you should already know
- How to plot coordinate points
- How to read information from charts and tables
- How to calculate the mean of a set of data from a frequency table
- How to recognise a positive or negative gradient

Quick check

The table shows the number of children in 10 classes in a primary school. Calculate the mean number of children in each class.

<table>
<thead>

<td>2</td>
<td>4</td>
<td>2</td>
<td>1</td>
</tr>
</tbody>
</table>
Line graphs are usually used in statistics to show how data changes over a period of time. One use is to indicate trends: for example, line graphs can be used to show whether the Earth’s temperature is increasing as the concentration of carbon dioxide builds up in the atmosphere, or whether a firm’s profit margin is falling year on year.

Line graphs are best drawn on graph paper.

---

**EXAMPLE 1**

This line graph shows the profit made each year by a company over a five-year period.

For this graph, the values between the plotted points have no meaning because the profit of the company would have been calculated at the end of every year. In cases like this, the lines are often dashed. Although the trend appears to be that profits have fallen after 2002, it would not be sensible to try to predict what will happen after 2005.

---

**EXERCISE 18A**

<td>10</td>
</tr>
<tr>
<td>Minimum (°C)</td>
<td>4</td>
<td>5</td>
<td>7</td>
<td>8</td>
<td>7</td>
<td>4</td>
<td>3</td>
</tr>
</tbody>
</table>

a. Draw line graphs on the same axes to show the maximum and minimum temperatures.

b. Find the smallest and greatest difference between the maximum and minimum temperatures.

### 18.2 Stem-and-leaf diagrams

**In this section you will learn how to:**
- draw and read information from an ordered stem-and-leaf diagram

**Key words**
- discrete data
- ordered
- raw data
- unordered

#### Raw data

If you are recording the ages of the first 20 people who line up at a bus stop in the morning, the raw data might look like this.

23, 13, 34, 44, 26, 12, 41, 31, 20, 18, 19, 31, 48, 32, 45, 14, 12, 27, 31, 19

This data is unordered and is difficult to read and analyse. When the data is ordered, it looks like this.

12, 12, 13, 14, 18, 19, 19, 20, 23, 26, 27, 31, 31, 31, 32, 34, 41, 44, 45, 48

This is easier to read and analyse.

Another method for displaying discrete data such as this, is a stem-and-leaf diagram. The tens values will be the “stem” and the units values will be the “leaves”.

<table>
<thead>
<tr>
<th>Key: 1 2 represents 12</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>4</td>
</tr>
</tbody>
</table>

This is called an ordered stem-and-leaf diagram and gives a better idea of how the data is distributed.

A stem-and-leaf diagram should always have a key.

The heights of 15 tulips are measured.
43 cm, 39 cm, 41 cm, 29 cm, 36 cm,
34 cm, 43 cm, 48 cm, 38 cm, 35 cm,
41 cm, 38 cm, 43 cm, 28 cm, 48 cm
a Show the results in an ordered stem-and-leaf diagram, using this key.
Key: 4 3 represents 43 cm
b What is the modal height?
c What is the median height?
d What is the range of the heights?

A student records the number of text messages she receives each day for two weeks.
12, 18, 21, 9, 17, 23, 8, 2, 20, 13, 17, 22, 9, 9
a Show the results in an ordered stem-and-leaf diagram, using this key.
Key: 1 2 represents 12 messages
b What was the modal number of text messages received in a day?
c What was the median number of text messages received in a day?
A **scatter diagram** (also called a scattergraph or scattergram) is a method of comparing two **variables** by plotting on a graph their corresponding values (usually taken from a table). In other words, the variables are treated just like a set of \((x, y)\) coordinates.

In the scatter diagram below, the marks scored by pupils in an English test are plotted against the marks they scored in a mathematics test. This graph shows positive **correlation**. This means that the pupils who got high marks in the mathematics test also tended to get high marks in the English test.

**Correlation**

This section will explain the different types of correlation.

Here are three statements that may or may not be true.

- The taller people are, the wider their arm span is likely to be.
- The older a car is, the lower its value will be.
- The distance you live from your place of work will affect how much you earn.
These relationships could be tested by collecting data and plotting the data on a scatter diagram.

For example, the first statement may give a scatter diagram like the first diagram above. This diagram has positive correlation because as one quantity increases so does the other. From such a scatter diagram we could say that the taller someone is, the wider the arm span.

Testing the second statement may give a scatter diagram like the second one. This diagram has negative correlation because as one quantity increases, the other quantity decreases. From such a scatter diagram we could say that as a car gets older, its value decreases.

Testing the third statement may give a scatter diagram like the third one. This scatter diagram has no correlation. There is no relationship between the distance a person lives from his or her work and how much the person earns.

**EXAMPLE 3**

The graphs show the relationship between the temperature and the amount of ice cream sold, and that between the age of people and the amount of ice cream they eat.

a Comment on the correlation of each graph.

b What does each graph tell you?

The first graph has positive correlation and tells us that as the temperature increases, the amount of ice cream sold increases.

The second graph has negative correlation and tells us that as people get older, they eat less ice cream.
Line of best fit

This section will explain how to draw and use a line of best fit.

The line of best fit is a straight line that goes between all the points on a scatter diagram, passing as close as possible to all of them. You should try to have the same number of points on both sides of the line. Because you are drawing this line by eye, examiners make a generous allowance around the correct answer. The line of best fit for the scatter diagram on page 419 is shown below.

The line of best fit can be used to answer the following type of question: A girl took the mathematics test and scored 75 marks, but was ill for the English test. How many marks was she likely to have scored?

The answer is found by drawing a line up from 75 on the mathematics axis to the line of best fit and then drawing a line across to the English axis. This gives 73, which is the mark she is likely to have scored in the English test.

Describe the correlation of each of these four graphs and write in words what each graph tells you.
The table shows the results of a science experiment in which a ball is rolled along a desk top. The speed of the ball is measured at various points.

<table>
<thead>
<tr>
<th>Distance from start (cm)</th>
<th>10</th>
<th>20</th>
<th>30</th>
<th>40</th>
<th>50</th>
<th>60</th>
<th>70</th>
<th>80</th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed (cm/s)</td>
<td>18</td>
<td>16</td>
<td>13</td>
<td>10</td>
<td>7</td>
<td>5</td>
<td>3</td>
<td>0</td>
</tr>
</tbody>
</table>

a. Plot the data on a scatter diagram.

b. Draw the line of best fit.

c. If the ball’s speed had been measured at 5 cm from the start, what is it likely to have been?

d. How far from the start was the ball when its speed was 12 cm/s?

The table shows the marks for ten pupils in their mathematics and geography examinations.

<table>
<thead>
<tr>
<th>Pupil</th>
<th>Maths</th>
<th>Geog</th>
</tr>
</thead>
<tbody>
<tr>
<td>Anna</td>
<td>57</td>
<td>45</td>
</tr>
<tr>

<td>23</td>
</tr>
<tr>
<td>Joan</td>
<td>35</td>
<td>34</td>
</tr>
</tbody>
</table>

a. Plot the data on a scatter diagram. Take the x-axis for the mathematics scores and mark it from 20 to 100. Take the y-axis for the geography scores and mark it from 20 to 100.

b. Draw the line of best fit.

c. One of the pupils was ill when she took the geography examination. Which pupil was it most likely to be?

d. If another pupil, Kate, was absent for the geography examination but scored 75 in mathematics, what mark would you expect her to have got in geography?

e. If another pupil, Lynne, was absent for the mathematics examination but scored 65 in geography, what mark would you expect her to have got in mathematics?

The heights, in centimetres, of twenty mothers and their 15-year-old daughters were measured. These are the results.

<table>
<thead>
<tr>
<th>Mother</th>
<th>153</th>
<th>162</th>
<th>147</th>

</tbody>
</table>

a Plot these results on a scatter diagram. Take the x-axis as the number of hours playing sport and mark it from 0 to 20. Take the y-axis as the number of hours watching TV and mark it from 0 to 30.

b If you knew that another pupil from the form watched 8 hours of TV a week, would you be able to predict how long she or he spent playing sport? Explain why.

18.4 Cumulative frequency diagrams

In this section you will learn how to:

- find a measure of dispersion (the interquartile range) and a measure of location (the median) using a graph

Key words

- cumulative frequency diagram
- dispersion
- interquartile range
- lower quartile
- median
- upper quartile

The interquartile range is a measure of the dispersion of a set of data. The advantage of the interquartile range is that it eliminates extreme values, and bases the measure of spread on the middle 50% of the data. This section will show how to find the interquartile range, and the median, of a set of data by drawing a cumulative frequency diagram.

Look back at the marks of the 50 pupils in the mathematics test (see page 419). These can be put into a grouped table, as shown on the next page. Note that it includes a column for the cumulative frequency, which is found by adding each frequency to the sum of all preceding frequencies.
This data can then be used to plot a graph of the top value of each group against its cumulative frequency. The points to be plotted are (30, 1), (40, 7), (50, 13), (60, 21), etc., which will give the graph shown below. Note that the cumulative frequency is always the vertical (y) axis.

The plotted points can be joined in two different ways:
- by straight lines, to give a cumulative frequency polygon
- by a freehand curve, to give a cumulative frequency curve or ogive.

They are both called cumulative frequency diagrams.

In an examination you are most likely to be asked to draw a cumulative frequency diagram, and the type (polygon or curve) is up to you. Both will give similar results. The cumulative frequency diagram can be used in several ways, as you will now see.

**The median**

The median is the middle item of data once all the items have been put in order of size, from lowest to highest. So, if you have \( n \) items of data plotted as a cumulative frequency diagram, the median can be found from the middle value of the cumulative frequency, that is the \( \frac{n}{2} \)th value.
But remember, if you want to find the median from a simple list of discrete data, you must use the \( \frac{n+1}{2} \)th value. The reason for the difference is that the cumulative frequency diagram treats the data as continuous, even when using data such as examination marks which are discrete. The reason you can use the \( \frac{3}{4}n \)th value when working with cumulative frequency diagrams is that you are only looking for an estimate of the median.

There are 50 values in the table on page 424. The middle value will be the 25th value. Draw a horizontal line from the 25th value to meet the graph then go down to the horizontal axis. This will give an estimate of the median. In this example, the median is about 65 marks.

**The interquartile range**

By dividing the cumulative frequency into four parts, we obtain quartiles and the interquartile range.

The **lower quartile** is the item one quarter of the way up the cumulative frequency axis and is found by looking at the \( \frac{n}{4} \)th value.

The **upper quartile** is the item three-quarters of the way up the cumulative frequency axis and is found by looking at the \( \frac{3n}{4} \)th value.

The **interquartile range** is the difference between the lower and upper quartiles.

These are illustrated on the graph below.

![Graph showing cumulative frequency and quartiles](image)

The quarter and three-quarter values out of 50 values are the 12.5th value and the 37.5th value. Draw lines across to the cumulative frequency curve from these values and down to the horizontal axis. These give the lower and upper quartiles. In this example, the lower quartile is 49 marks, the upper quartile is 83 marks, and the interquartile range is \( 83 - 49 = 34 \) marks.

Note that problems like these are often followed up with an extra question such as: The Head of Mathematics decides to give a special award to the top 10% of pupils. What would the cut-off mark be?

The top 10% would be the top 5 pupils (10% of 50 is 5). Draw a line across from the 45th pupil to the graph and down to the horizontal axis. This gives a cut-off mark of 95.
EXAMPLE 4

The table below shows the marks of 100 pupils in a mathematics SAT.

a. Draw a cumulative frequency curve.

b. Use your graph to find the median and the interquartile range.

c. Pupils who score less than 44 do not get a SAT level awarded. How many pupils will not get a SAT level?

The groups are given in a different way to those in the table on page 424. You will meet several ways of giving groups (for example, 21–30, 20 < x ≤ 30, 21 < x ≤ 30) but the important thing to remember is to plot the top point of each group against the corresponding cumulative frequency.

<table>
<thead>
<tr>
<th>Mark</th>
<th>Number of pupils</th>
<th>Cumulative frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>21 ≤ x ≤ 30</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>31 ≤ x ≤ 40</td>
<td>9</td>
<td>12</td>
</tr>
<tr>
<td>41 ≤ x ≤ 50</td>
<td>12</td>
<td>24</td>
</tr>
<tr>
<td>51 ≤ x ≤ 60</td>
<td>15</td>
<td>39</td>
</tr>
<tr>
<td>61 ≤ x ≤ 70</td>
<td>22</td>
<td>61</td>
</tr>
<tr>
<td>71 ≤ x ≤ 80</td>
<td>16</td>
<td>77</td>
</tr>
<tr>
<td>81 ≤ x ≤ 90</td>
<td>10</td>
<td>87</td>
</tr>
<tr>
<td>91 ≤ x ≤ 100</td>
<td>8</td>
<td>95</td>
</tr>
<tr>
<td>101 ≤ x ≤ 110</td>
<td>3</td>
<td>98</td>
</tr>
<tr>
<td>111 ≤ x ≤ 120</td>
<td>2</td>
<td>100</td>
</tr>
</tbody>
</table>

The required answers are read from the graph.

Median = 65 marks
Lower quartile = 51 marks
Upper quartile = 79 marks
Interquartile range = 79 – 51 = 28 marks

c. At 44 on the mark axis draw a perpendicular line to intersect the graph, and at the point of intersection draw a horizontal line across to the cumulative frequency axis, as shown.
Number of pupils without a SAT level = 18
Note, an alternative way in which the table in Example 4 could have been set out is shown below. This arrangement has the advantage that the points to be plotted are taken straight from the last two columns. You have to decide which method you prefer. In examination papers, the columns of tables are sometimes given without headings, so you will need to be familiar with all the different ways in which the data can be set out.

A class of 30 children was asked to estimate one minute. The teacher recorded the times the pupils actually said. The table on the right shows the results.

a Copy the table and complete a cumulative frequency column.

b Draw a cumulative frequency diagram.

c Use your diagram to estimate the median time and the interquartile range.

d Which group, the children or the pensioners, would you say was better at estimating time? Give a reason for your answer.

A group of 50 pensioners was given the same task as the children in question 1. The results are shown in the table on the right.

a Copy the table and complete a cumulative frequency column.

b Draw a cumulative frequency diagram.

c Use your diagram to estimate the median time and the interquartile range.

d Which group, the children or the pensioners, would you say was better at estimating time? Give a reason for your answer.
The sizes of 360 secondary schools in South Yorkshire are recorded in the table on the right.

a. Copy the table and complete a cumulative frequency column.

b. Draw a cumulative frequency diagram.

c. Use your diagram to estimate the median size of the schools and the interquartile range.

d. Schools with less than 350 pupils are threatened with closure. About how many schools are threatened with closure?

The temperature at a seaside resort was recorded over a period of 50 days. The temperature was recorded to the nearest degree. The table on the right shows the results.

a. Copy the table and complete a cumulative frequency column.

b. Draw a cumulative frequency diagram.

Note that as the temperature is to the nearest degree the top values of the groups are 7.5°C, 10.5°C, 13.5°C, 16.5°C, etc.

c. Use your diagram to estimate the median temperature and the interquartile range.

At the school charity fête, a game consists of throwing three darts and recording the total score. The results of the first 80 people to throw are recorded in the table on the right.

a. Draw a cumulative frequency diagram to show the data.

b. Use your diagram to estimate the median score and the interquartile range.

c. People who score over 90 get a prize. About what percentage of the people get a prize?

One hundred pupils in a primary school were asked to say how much pocket money they each get in a week. The results are in the table on the right.

a. Copy the table and complete a cumulative frequency column.

b. Draw a cumulative frequency diagram.

c. Use your diagram to estimate the median amount of pocket money and the interquartile range.
Another way of displaying data for comparison is by means of a box-and-whisker plot (or just **box plot**). This requires five pieces of data. These are the **lowest value**, the **lower quartile** ($Q_1$), the **median** ($Q_2$), the **upper quartile** ($Q_3$) and the **highest value**. They are drawn in the following way.

![Box plot diagram]

These data are always placed against a scale so that their values are accurately plotted.

The following diagrams show how the cumulative frequency curve, the frequency curve and the box plot are connected for three common types of distribution.
The box plot shows the times taken for a group of pensioners to do a set of ten long-division calculations.

The same set of calculations was given to some students in Year 11. Their results are: shortest time 3 minutes 20 seconds; lower quartile 6 minutes 10 seconds; median 7 minutes; upper quartile 7 minutes 50 seconds; longest time 9 minutes 40 seconds.

a Copy the diagram and draw a box plot for the students’ times.

b Comment on the differences between the two distributions.

The box plots for the noon temperature at two resorts, recorded over a year, are shown on the grid below.

![Box plots for noon temperature at two resorts](image)

**a** Comment on the differences in the two distributions.

**b** Mary wants to go on holiday in July. Which resort would you recommend and why?

The following table shows some data on the annual salary for 100 men and 100 women.

<table>
<thead>

WORKED EXAM QUESTION

Derek makes men’s and women’s shirts. He needs to know the range of collar sizes so he measures 100 men’s necks. The results are shown in the table.

a  Draw a cumulative frequency diagram to show this information
b  Use the diagram to find
   i  the median
   ii the interquartile range
c  The box plot shows the neck sizes of 100 women.

Solution

a  Cumulative Frequencies: 5, 21, 49, 86, 96, 100

b

<table>
<thead>
<tr>
<th>Neck size, ( n ) (cm)</th>

Median = 15 cm

IQR = 15.7 − 14.2 = 1.5 cm

c  The men have a higher median (about 1.5 cm higher) and the women have a larger interquartile range (About 2.5 cm compared to 1.5 cm)
Michael Jones is a journalist. He writes articles for a monthly magazine.

He is asked to write a report on the changes in the population of the UK over the 25 years from 1976 to 2001.

Michael does some research, and finds the following figures for 1976 and 2001. He calculates the percentage change for each age group to the nearest percent. Help him to complete the table.

Finally he wants to find the median ages and interquartile ranges (IQR).

Complete the cumulative frequencies below, then draw cumulative frequency graphs and use them to find the median and IQR for both years.

Michael summarises the statistical data in a table. He rounds every answer to the nearest whole number of years. Complete the table for him.
He writes the following article. Write down the words that should go in the spaces.

**Are we living longer?**

Michael Jones reports on the change in the population of the UK from 1976 to 2001.

The total population for the UK in 1976 was approximately 56.1 million, which increased to 58.8 million in 2001. This means that over 25 years, the population has grown by ____ million people. During this time period, the largest percentage increase occurred in the age group____ with a staggering ____% increase.

However the largest percentage decrease of ____% occurred in the age group____. The reasons for this could possibly be due to rationing and a shortage of men in the decade following the second world war.

The mean age of the population has increased from ____ years old to ____ years old (both values are given to the nearest whole year). This increase of ____ years appears to reinforce the claim made by politicians that as medical science advances and our standard of living and diet improve, it means that we are living longer.

The median age for the two years shows a slightly larger increase than the mean, going from ____ years up to ____ years. The lower and upper quartiles also increase by ____ years, thus showing a shift upwards by ____ years of the central 50% of the population.

So, does this show a healthier, happier Britain? Well, it certainly appears that we are on average living longer. The mean and median both show the average age increasing. But, will the trend continue? Certainly our standard of living has improved, and the treatment of illnesses is improving at a rapid rate, but what about our eating habits? These too are changing.

Fast food + less exercise = obesity. Is this the maths equation that will reverse the trend in the age of the population?

Read next months article, *We are what we eat – true or false?* which looks more closely at the UK’s expanding waistlines.

Do you think this article is well written? Is it misleading in any way? Can you write a better article for him?
GRADE YOURSELF

- Able to draw an ordered stem-and-leaf diagram
- Able to draw a line of best fit on a scatter diagram
- Recognise the different types of correlation
- Able to interpret a line of best fit
- Able to draw a cumulative frequency diagram
- Able to find medians and quartiles from cumulative frequency diagrams
- Able to draw and interpret box plots

What you should know now

- How to read information from statistical diagrams including stem-and-leaf diagrams
- How to plot scatter diagrams, recognise correlation, draw lines of best fit and use them to predict values
- How to construct a cumulative frequency diagram
- How to draw and interpret box plots

This chapter will show you ...

- how to work out the probability of events, either using theoretical models or experimental models
- how to predict outcomes using theoretical models and compare experimental and theoretical data
- how to calculate probabilities for combined events

What you should already know

- That the probability scale goes from 0 to 1
- How to use the probability scale and to assess the likelihood of events depending on their position on the scale
- How to cancel, add and subtract factors

Quick check

1. Draw a probability scale and put an arrow to show approximately the probability of each of the following events happening.
   a. The next TV programme you watch will have been made in Britain.
   b. A person in your class will have been born in April.
   c. It will snow in July in Spain.
   d. In the next Olympic Games, a man will run the 100 m race in less than 20 seconds.
   e. During this week, you will drink some water or pop.
Terminology

The topic of probability has its own special terminology, which will be explained as it arises. For example, a trial is one go at performing something, such as throwing a dice or tossing a coin. So, if we throw a dice 10 times, we perform 10 trials.

Two other probability terms are event and outcome. An event is anything whose probability we want to measure. An outcome is any way in which an event can happen.

Another probability term is at random. This means “without looking” or “not knowing what the outcome is in advance”.

Note: “Dice” is used in this book in preference to “die” for the singular form of the noun, as well as for the plural. This is in keeping with growing common usage, including in examination papers.

Probability facts

The probability of a certain event is 1 and the probability of an impossible event is 0.

Probability is never greater than 1 or less than 0.

Many probability examples involve coins, dice and packs of cards. Here is a reminder of their outcomes.

- A coin has two outcomes: head or tail.
- An ordinary six-sided dice has six outcomes: 1, 2, 3, 4, 5, 6.
- A pack of cards consists of 52 cards divided into four suits: Hearts (red), Spades (black), Diamonds (red), and Clubs (black). Each suit consists of 13 cards bearing the following values: 2, 3, 4, 5, 6, 7, 8, 9, 10, Jack, Queen, King and Ace. The Jack, Queen and King are called “picture cards”. (The Ace is sometimes also called a picture card.) So the total number of outcomes is 52.

Probability is defined as

\[
P(\text{event}) = \frac{\text{Number of ways the event can happen}}{\text{Total number of all possible outcomes}}
\]

This definition always leads to a fraction which should be cancelled down to its simplest form. Make sure that you know how to cancel down fractions with or without a calculator. It is acceptable to give a probability as a decimal or a percentage but a fraction is better.

This definition can be used to work out the probability of events, as the following example shows.
The value of number of heads ÷ number of tosses is called an experimental probability. As the number of trials or experiments increases, the value of the experimental probability gets closer to the true or theoretical probability.

Experimental probability is also known as the relative frequency of an event. The relative frequency of an event is an estimate for the theoretical probability. It is given by

\[
\text{Relative frequency of an event} = \frac{\text{Frequency of the event}}{\text{Total number of trials}}
\]

**EXAMPLE 1**

A card is drawn from a pack of cards. What is the probability that it is one of the following?

a. a red card
b. a Spade
c. a seven
d. a picture card
e. a number less than 5
f. a red King

a. There are 26 red cards, so \( P(\text{red card}) = \frac{26}{52} = \frac{1}{2} \)
b. There are 13 Spades, so \( P(\text{Spade}) = \frac{13}{52} = \frac{1}{4} \)
c. There are four sevens, so \( P(\text{seven}) = \frac{4}{52} = \frac{1}{13} \)
d. There are 12 picture cards, so \( P(\text{picture card}) = \frac{12}{52} = \frac{3}{13} \)
e. If you count the value of an Ace as 1, there are 16 cards with a value less than 5.
So, \( P(\text{number less than 5}) = \frac{16}{52} = \frac{4}{13} \)
f. There are 2 red Kings, so \( P(\text{red King}) = \frac{2}{52} = \frac{1}{26} \)
Finding probabilities

There are three ways in which the probability of an event can be found.

- If we can work out the theoretical probability of an event – for example, drawing a King from a pack of cards – this is called using equally likely outcomes.

- Some events, such as buying a certain brand of dog food, cannot be calculated using equally likely outcomes. To find the probability of such an event, we can perform an experiment or conduct a survey. This is called collecting experimental data. The more data we collect, the better the estimate is.

- The probability of some events, such as an earthquake occurring in Japan, cannot be found by either of the above methods. One of the things we can do is to look at data collected over a long period of time and make an estimate (sometimes called a best guess) at the chance of the event happening. This is called looking at historical data.

**EXAMPLE 2**

The frequency table shows the speeds of 160 vehicles which pass a radar speed check on a dual carriageway.

<table>
<thead>
<tr>
<th>Speed (mph)</th>
<th>20–29</th>
<th>30–39</th>
<th>40–49</th>
<th>50–59</th>
<th>60–69</th>
<th>70+</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>14</td>
<td>23</td>
<td>25</td>
<td>52</td>
<td>52</td>
<td>8</td>
</tr>
</tbody>
</table>

a What is the experimental probability that a vehicle is travelling faster than 70 mph?

b If 500 vehicles pass the speed check, estimate how many will be travelling faster than 70 mph.

a The experimental probability is the relative frequency, which is \( \frac{8}{160} = \frac{1}{20} \)

b The number of vehicles travelling faster than 70 mph will be \( \frac{1}{20} \) of 500.

That is, 500 ÷ 20 = 25 vehicles

**EXAMPLE 3**

Which method (A, B or C) would you use to estimate the probabilities of the events a to e?

A: Use equally likely outcomes
B: Conduct a survey/collect data
C: Look at historical data

a Someone in your class will go abroad for a holiday this year.

b You will win the National Lottery.

c Your bus home will be late.

d It will snow on Christmas Day.

e You will pick a red seven from a pack of cards.
Naseer throws a dice and records the number of sixes that he gets after various numbers of throws. The table shows his results.

<table>
<thead>
<tr>
<th>Number of throws</th>
<th>10</th>
<th>50</th>
<th>100</th>
<th>200</th>
<th>500</th>
<th>1000</th>
<th>2000</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of sixes</td>
<td>2</td>
<td>4</td>
<td>10</td>
<td>21</td>
<td>74</td>
<td>163</td>
<td>329</td>
</tr>
</tbody>
</table>

a Calculate the experimental probability of a six at each stage that Naseer recorded his results.
b How many ways can a dice land?
c How many of these ways give a six?
d What is the theoretical probability of throwing a six with a dice?
e If Naseer threw the dice a total of 6000 times, how many sixes would you expect him to get?

Marie made a five-sided spinner, like the one shown in the diagram. She used it to play a board game with her friend Sarah. The girls thought that the spinner wasn’t very fair as it seemed to land on some numbers more than others. They spun the spinner 200 times and recorded the results. The results are shown in the table.

<table>
<thead>
<tr>
<th>Side spinner lands on</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of times</td>
<td>19</td>
<td>27</td>
<td>32</td>
<td>53</td>
<td>69</td>
</tr>
</tbody>
</table>

a Work out the experimental probability of each number.
b How many times would you expect each number to occur if the spinner is fair?
c Do you think that the spinner is fair? Give a reason for your answer.
Sarah thought she could make a much more accurate spinner. After she had made it, she tested it and recorded how many times she scored a 5. Her results are shown in the table.

<table>
<thead>
<tr>
<th>Number of spins</th>
<th>10</th>
<th>50</th>
<th>100</th>
<th>500</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of fives</td>
<td>3</td>
<td>12</td>
<td>32</td>
<td>107</td>
</tr>
</tbody>
</table>

a Sarah made a mistake in recording the number of fives. Which number in the second row above is wrong? Give a reason for your answer.

b These are the full results for 500 spins.

<table>
<thead>
<tr>
<th>Side spinner lands on</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of times</td>
<td>96</td>
<td>112</td>
<td>87</td>
<td>98</td>
<td>107</td>
</tr>
</tbody>
</table>

Do you think the spinner is fair? Give a reason for your answer.

A sampling bottle contains 20 balls. The balls are either black or white. (A sampling bottle is a sealed bottle with a clear plastic tube at one end into which one of the balls can be tipped.) Kenny conducts an experiment to see how many black balls are in the bottle. He takes various numbers of samples and records how many of them showed a black ball. The results are shown in the table.

<table>
<thead>
<tr>
<th>Number of samples</th>
<th>Number of black balls</th>
<th>Experimental probability</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>100</td>
<td>25</td>
<td></td>
</tr>
<tr>
<td>200</td>
<td>76</td>
<td></td>
</tr>
<tr>
<td>500</td>
<td>210</td>
<td></td>
</tr>
<tr>
<td>1000</td>
<td>385</td>
<td></td>
</tr>
<tr>
<td>5000</td>
<td>1987</td>
<td></td>
</tr>
</tbody>
</table>

a Copy the table and calculate the experimental probability of getting a black ball at each stage.

b Using this information, how many black balls do you think are in the bottle?

Another sampling bottle contains red, white and blue balls. It is known that there are 20 balls in the bottle altogether. Carrie performs an experiment to see how many of each colour are in the bottle. She starts off putting down a tally each time a colour shows in the clear plastic tube.

<table>
<thead>
<tr>
<th>Red</th>
<th>White</th>
<th>Blue</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Unfortunately, she forgets to count how many times she performs the experiment, so every now and again she counts up the tallies and records them in a table (see below).

<table>
<thead>
<tr>
<th>Red</th>
<th>White</th>
<th>Blue</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>
<td>18</td>
<td>12</td>
<td>52</td>
</tr>
<tr>
<td>48</td>
<td>31</td>
<td>16</td>
<td>95</td>
</tr>
<tr>
<td>65</td>
<td>37</td>
<td>24</td>
<td>126</td>
</tr>
<tr>
<td>107</td>
<td>61</td>
<td>32</td>
<td>200</td>
</tr>
<tr>
<td>152</td>
<td>93</td>
<td>62</td>
<td>307</td>
</tr>
<tr>
<td>206</td>
<td>128</td>
<td>84</td>
<td>418</td>
</tr>
</tbody>
</table>
The relative frequency of the red balls is calculated by dividing the frequency of red by the total number of trials, so at each stage these are

0.423  0.505  0.516  0.535  0.495  0.493

These answers are rounded off to three significant figures.

a Calculate the relative frequencies of the white balls at each stage to three significant figures.

b Calculate the relative frequencies of the blue balls at each stage to three significant figures.

c Round off the final relative frequencies for Carrie’s 418 trials to one decimal place.

d What is the total of the answers in part c?

e How many balls of each colour do you think are in the bottle? Explain your answer.

Using card and a cocktail stick, make a six-sided spinner, as shown below.

When you have made the spinner, spin it 120 times and record your results in a table like the one below.

<table>
<thead>
<tr>
<th>Number</th>
<th>Tally</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

a Which number occurred the most?

b How many times would you expect to get each number?

c Is your spinner fair?

d Explain your answer to part c.

Use a set of number cards from 1 to 10 (or make your own set) and work with a partner. Take it in turns to choose a card and keep a record each time of what card you get. Shuffle the cards each time and repeat the experiment 60 times. Put your results in a copy of this table.

<table>
<thead>
<tr>

<td>61 46 26 17</td>
</tr>
</tbody>
</table>

a Which pupil will have the most reliable set of results? Why?

b Add up all the score columns and work out the relative frequency of each score. Give your answers to two decimal places.

c Is the dice biased? Explain your answer.

Which of these methods would you use to estimate or state the probability of each of the events a to h?

Method A: Equally likely outcomes
Method B: Survey or experiment
Method C: Look at historical data

a How people will vote in the next election.

b A drawing pin dropped on a desk will land point up.

c A Premiership football team will win the FA Cup.

d You will win a school raffle.

e The next car to drive down the road will be red.

f You will throw a “double six” with two dice.

g Someone in your class likes classical music.

h A person picked at random from your school will be a vegetarian.

If you were about to choose a card from a pack of yellow cards numbered from 1 to 10, what would be the chance of each of the events a to i occurring? Copy and complete each of these statements with a word or phrase chosen from “impossible”, “not likely”, “50–50 chance”, “quite likely”, or “certain”.

a The likelihood that the next card chosen will be a four is ...... 

b The likelihood that the next card chosen will be pink is ...... 

c The likelihood that the next card chosen will be a seven is ...... 

d The likelihood that the next card chosen will be a number less than 11 is ......
e The likelihood that the next card chosen will be a number bigger than 11 is ……
f The likelihood that the next card chosen will be an even number is ……
g The likelihood that the next card chosen will be a number more than 5 is ……
h The likelihood that the next card chosen will be a multiple of 1 is ……
i The likelihood that the next card chosen will be a prime number is ……

If a bag contains three black, two yellow and five white balls and only one ball is allowed to be taken at random from the bag, then by the basic definition of probability

\[
P(\text{black ball}) = \frac{3}{10} \\
P(\text{yellow ball}) = \frac{2}{10} = \frac{1}{5} \\
P(\text{white ball}) = \frac{5}{10} = \frac{1}{2}
\]

We can also say that the probability of choosing a black ball or a yellow ball is \( \frac{5}{10} = \frac{1}{2} \).

The events “picking a yellow ball” and “picking a black ball” can never happen at the same time when only one ball is taken out: that is, a ball can be either black or yellow. Such events are called mutually exclusive. Other examples of mutually exclusive events are tossing a head or a tail with a coin, drawing a King or an Ace from a pack of cards and throwing an even or an odd number with a dice.

An example of events that are not mutually exclusive would be drawing a red card and a King from a pack of cards. There are two red Kings, so these events could be true at the same time.
Events such as those in Example 4 are mutually exclusive because they can never happen at the same time. Because there are no other possibilities, they are also called **exhaustive** events. The probabilities of exhaustive events add up to 1.

**Complementary event**

If there is an event $A$, the **complementary** event of $A$ is

$A$ not happening

Any event is mutually exclusive and exhaustive to its complementary event. That is,

$P(\text{event } A \text{ not happening}) = 1 - P(\text{event } A \text{ happening})$

which can be stated as

$P(\text{event}) + P(\text{complementary event}) = 1$

For example, the probability of getting a King from a pack of cards is $\frac{4}{52} = \frac{1}{13}$, so the probability of not getting a King is

$1 - \frac{1}{13} = \frac{12}{13}$
Say whether these pairs of events are mutually exclusive or not.

1. Tossing a head with a coin/tossing a tail with a coin
2. Throwing a number less than 3 with a dice/throwing a number greater than 3 with a dice
3. Drawing a Spade from a pack of cards/drawing an Ace from a pack of cards
4. Drawing a Spade from a pack of cards/drawing a red card from a pack of cards
5. If two people are to be chosen from three girls and two boys: choosing two girls/choosing two boys
6. Drawing a red card from a pack of cards/drawing a black card from a pack of cards

Which of the pairs of mutually exclusive events in question 1 are also exhaustive?

Each morning I run to work or get a lift. The probability that I run to work is \( \frac{2}{5} \).
What is the probability that I get a lift?

A letter is to be chosen at random from this set of letter-cards.

- What is the probability the letter is
  - i. an S?
  - ii. a T?
  - iii. a vowel?

- Which of these pairs of events are mutually exclusive?
  - i. picking an S / picking a T
  - ii. picking an S / picking a vowel
  - iii. picking an S / picking another consonant
  - iv. picking a vowel / picking a consonant

- Which pair of mutually exclusive events in part b is also exhaustive?

Two people are to be chosen for a job from this set of five people.

- List all of the possible pairs (there are 10 altogether).

- What is the probability that the pair of people chosen will
  - i. both be female?
  - ii. both be male?
  - iii. both have the same initial?
  - iv. have different initials?

- Which of these pairs of events are mutually exclusive?
  - i. picking two women/picking two men
  - ii. picking two people of the same sex/picking two people of opposite sex
  - iii. picking two people with the same initial/picking two men
  - iv. picking two people with the same initial/picking two women

- Which pair of mutually exclusive events in part c is also exhaustive?
A spinner consists of an outer ring of coloured sectors and an inner circle of numbered sectors, as shown.

a The probability of getting 2 is $\frac{1}{4}$. The probabilities of getting 1 or 3 are equal. What is the probability of getting 3?

b The probability of getting blue is $\frac{1}{4}$. The probability of getting white $\frac{1}{4}$. The probability of getting green is $\frac{3}{8}$. What is the probability of getting red?

c Which of these pairs of events are mutually exclusive?

i getting 3/getting 2

ii getting 3/getting green

iii getting 3/getting blue

iv getting blue/getting red

d Explain why it is not possible to get a colour that is mutually exclusive to the event “getting an odd number”.

At the morning break, I have the choice of coffee, tea or hot chocolate. If the probability I choose coffee is $\frac{3}{5}$, the probability I choose tea is $\frac{1}{4}$, what is the probability I choose hot chocolate?

Assemblies at school are always taken by the head, the deputy head or the senior teacher. If the head takes the assembly, the probability that she goes over time is $\frac{1}{2}$. If the deputy takes the assembly, the probability that he goes over time is $\frac{1}{4}$. Explain why it is not necessarily true to say that the probability that the senior teacher goes over time is $\frac{1}{4}$.

A hotelier conducted a survey of guests staying at her hotel. The table shows some of the results of her survey.

<table>
<thead>
<tr>
<th>Type of guest</th>
<th>Probability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Man</td>
<td>0.7</td>
</tr>
<tr>
<td>Woman</td>
<td>0.3</td>
</tr>
<tr>
<td>American man</td>
<td>0.2</td>
</tr>
<tr>
<td>American woman</td>
<td>0.05</td>
</tr>
<tr>
<td>Vegetarian</td>
<td>0.3</td>
</tr>
<tr>
<td>Married</td>
<td>0.6</td>
</tr>
</tbody>
</table>

a A guest was chosen at random. From the table, work out these probabilities.

i the guest was American

ii the guest was single

iii the guest was not a vegetarian

b Explain why it is not possible to work out from the table the probability of a guest being a married vegetarian.

c From the table, give two examples of pairs of types of guest that would form a pair of mutually exclusive events.

d From the table, give one example of a pair of types of guest that would form a pair of exhaustive events.
When we know the probability of an event, we can predict how many times we would expect that event to happen in a certain number of trials.

Note that this is what we expect. It is not what is going to happen. If what we expected always happened, life would be very dull and boring and the National Lottery would be a waste of time.

**EXAMPLE 6**

A bag contains 20 balls, nine of which are black, six white and five yellow. A ball is drawn at random from the bag, its colour noted and then it is put back in the bag. This is repeated 500 times.

- **a** How many times would you expect a black ball to be drawn?
- **b** How many times would you expect a yellow ball to be drawn?
- **c** How many times would you expect a black or a yellow ball to be drawn?

a  \( P(\text{black ball}) = \frac{9}{20} \)

Expected number of black balls = \( \frac{9}{20} \times 500 = 225 \)

b  \( P(\text{yellow ball}) = \frac{5}{20} = \frac{1}{4} \)

Expected number of yellow balls = \( \frac{1}{4} \times 500 = 125 \)

c  Expected number of black or yellow balls = 225 + 125 = 350

**EXAMPLE 7**

Four in 10 cars sold in Britain are made by Japanese companies.

- **a** What is the probability that the next car to drive down your road will be Japanese?
- **b** If there are 2000 cars in a multistorey car park, how many of them would you expect to be Japanese?

a  \( P(\text{Japanese car}) = \frac{4}{10} = \frac{2}{5} = 0.4 \)

b  Expected number of Japanese cars in 2000 cars = \( 0.4 \times 2000 = 800 \) cars
I throw an ordinary dice 150 times. How many times can I expect to get a score of 6?

I toss a coin 2000 times. How many times can I expect to get a head?

I draw a card from a pack of cards and replace it. I do this 520 times. How many times would I expect to get these?

a a black card
b a King
c a Heart
d the King of Hearts

The ball in a roulette wheel can land in 37 spaces which are the numbers between 0 and 36 inclusive. I always bet on the same number, 13. If I play all evening and there is a total of 185 spins of the wheel in that time, how many times could I expect to win?

In a bag there are 30 balls, 15 of which are red, 5 yellow, 5 green, and 5 blue. A ball is taken out at random and then replaced. This is repeated 300 times. How many times would I expect to get these outcomes?

a a red ball
b a yellow or blue ball
c a ball that is not blue
d a pink ball

The same experiment described in question 5 is carried out 1000 times. Approximately how many times would you expect to get a green ball, a ball that is not blue?

A sampling bottle (as described in question 4 of Exercise 19A) contains red and white balls. It is known that the probability of getting a red ball is 0.3. 1500 samples are taken. How many of them would you expect to give a white ball?

Josie said: “When I throw a dice, I expect to get a score of 3.5.”

“Impossible,” said Paul, “you can’t score 3.5 with a dice.”

“So this and I’ll prove it,” said Josie.

a An ordinary dice is thrown 60 times. Fill in the table for the expected number of times each score will occur.

<table>
<thead>
<tr>
<th>Score</th>
<th>Expected occurrences</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

b Now work out the average score that is expected over 60 throws.

c There is an easy way to get an answer of 3.5 for the expected average score. Can you see what it is?

I have 20 tickets for a raffle and I know that the probability of my winning the prize is 0.05. How many tickets were sold altogether in the raffle?
A two-way table is a table that links together two variables. For example, the following table shows how many boys and girls are in a form and whether they are left- or right-handed.

<table>
<thead>
<tr>
<th></th>
<th>Boys</th>
<th>Girls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left-handed</td>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>Right-handed</td>
<td>10</td>
<td>13</td>
</tr>
</tbody>
</table>

This table shows the colour and make of cars in the school car park.

<table>
<thead>
<tr>
<th>Make</th>
<th>Red</th>
<th>Blue</th>
<th>White</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ford</td>
<td>2</td>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td>Vauxhall</td>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>Toyota</td>
<td>3</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>Peugeot</td>
<td>2</td>
<td>0</td>
<td>3</td>
</tr>
</tbody>
</table>

One variable is written in the rows of the table and the other variable is written in the columns of the table.

**EXAMPLE 8**

Using the first two-way table above, answer these questions.

a. If a pupil is selected at random from the form what is the probability that the pupil is a left-handed boy?

b. It is known that a pupil selected at random is a girl. What is the probability that she is right-handed?

\[
\begin{align*}
\text{a} & \quad \frac{2}{23} \\
\text{b} & \quad \frac{13}{17}
\end{align*}
\]

**EXAMPLE 9**

Using the second two-way table above, answer these questions.

a. What percentage of the cars in the car park are red?

b. What percentage of the white cars are Vauxhalls?

\[
\begin{align*}
\text{a} & \quad 28\%. \text{ Seven out of 25 is the same as 28 out of 100.} \\
\text{b} & \quad 20\%. \text{ Two out of 10 is 20%}
\end{align*}
\]
The two-way table shows the age and sex of a sample of 50 pupils in a school.

<table>
<thead>
<tr>
<th>Age (years)</th>
<th>11</th>
<th>12</th>
<th>13</th>
<th>14</th>
<th>15</th>
<th>16</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of boys</td>
<td>4</td>
<td>3</td>
<td>6</td>
<td>2</td>
<td>5</td>
<td>4</td>
</tr>
<tr>
<td>Number of girls</td>
<td>2</td>
<td>5</td>
<td>3</td>
<td>6</td>
<td>4</td>
<td>6</td>
</tr>
</tbody>
</table>

a How many pupils are aged 13 years or less?

b What percentage of the pupils in the table are 16?

c A pupil from the table is selected at random. What is the probability that the pupil will be 14 years of age. Give your answer as a fraction in its lowest form.

d There are 1000 pupils in the school. Use the table to estimate how many boys are in the school altogether.

The two-way table shows the number of adults and the number of cars in 50 houses in one street.

<table>
<thead>
<tr>
<th>Number of cars</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of adults</td>
<td>2</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>3</td>
<td>13</td>
<td>3</td>
<td>1</td>

</tr>
<tr>
<td>2</td>
<td>0</td>
<td>10</td>
<td>6</td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>0</td>
<td>1</td>
<td>4</td>
<td>2</td>
<td></td>
</tr>
</tbody>
</table>

a How many houses have exactly two adults and two cars?

b How many houses altogether have three cars?

c What percentage of the houses have three cars?

d What percentage of the houses with just one car have three adults living in the house?

Jane has two four-sided spinners. One has the numbers 1 to 4 and the other has the numbers 5 to 8.

Both spinners are spun together.

The two-way table (on the next page) shows all the ways the two spinners can land.

Some of the total scores are filled in.
a Complete the table to show all the possible total scores.
b How many of the total scores are 9?
c When the two spinners are spun together what is the probability that the total score will be
   i 9?
   ii 8?
   iii a prime number?

The table shows information about the number of items in Flossy’s music collection.

<table>
<thead>
<tr>
<th>Type of music</th>
<th>Pop</th>
<th>Folk</th>
<th>Classical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tape</td>
<td>16</td>
<td>5</td>
<td>2</td>

<tr>
<td>CD</td>
<td>51</td>
<td>9</td>
<td>13</td>
</tr>
<tr>
<td>Mini disc</td>
<td>9</td>
<td>2</td>
<td>0</td>
</tr>
</tbody>
</table>

a How many pop tapes does Flossy have?
b How many items of folk music does Flossy have?
c How many CDs does Flossy have?
d If a CD is chosen at random from all the CDs, what is the probability that it will be a pop CD?

Zoe throws a fair coin and rolls a fair dice.
If the coin shows a head she records the score on the dice.
If the coin shows tails she doubles the number on the dice.
a Complete the two-way table to show Zoe’s possible scores.

<table>
<thead>
<tr>
<th>Number on dice</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>

<td>2</td>
<td>4</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

b How many of the scores are square numbers?
c What is the probability of getting a score that is a square number?
A gardener plants some sunflower seeds in a greenhouse and plants some in the garden. After they have fully grown, he measures the diameter of the sunflower heads. The table shows his results.

<table>
<thead>
<tr>
<th></th>
<th>Greenhouse</th>
<th>Garden</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mean diameter</td>
<td>16.8 cm</td>
<td>14.5 cm</td>
</tr>
<tr>
<td>Range of diameter</td>
<td>3.2 cm</td>
<td>1.8 cm</td>
</tr>
</tbody>
</table>

a The gardener who wants to enter competitions says “the sunflowers from the greenhouse are better”.

Using the data in the table, give a reason to justify this statement.

b The gardener’s wife, who does flower arranging says “the sunflowers from the garden are better”.

Using the data in the table, give a reason to justify this statement.

The two-way table shows the wages for the men and women in a factory.

<table>
<thead>
<tr>
<th>Wage, w, (£) per week</th>
<th>Men</th>
<th>Women</th>
</tr>
</thead>
<tbody>
<tr>
<td>£100 &lt; w ≤ £150</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>£150 &lt; w ≤ £200</td>
<td>7</td>
<td>5</td>
</tr>
<tr>
<td>£200 &lt; w ≤ £250</td>
<td>23</td>
<td>12</td>
</tr>
<tr>
<td>£250 &lt; w ≤ £300</td>
<td>48</td>
<td>27</td>
</tr>
<tr>
<td>£300 &lt; w ≤ £350</td>
<td>32</td>
<td>11</td>
</tr>
<tr>
<td>More than £350</td>
<td>7</td>
<td>1</td>
</tr>
</tbody>
</table>

a What percentage of the men earn between £250 and £300 per week?

b What percentage of the women earn between £250 and £300 per week?

a Is it possible to work out the mean wage of the men and women? Explain your answer.

---

**Addition rule for events**

In this section you will learn how to:

- work out the probability of two events such as \( P(\text{event A}) \) or \( P(\text{event B}) \)

Key word

*either*

We have used the addition rule already but it has not yet been formally defined.

When two events are mutually exclusive, we can work out the probability of *either* of them occurring by adding up the separate probabilities.
The last part of Example 10 is another illustration of how confusing probability can be. You might think

\[
P(\text{neither green nor blue}) = P(\text{not green}) + P(\text{not blue}) = \frac{3}{5} + \frac{3}{5} = 1.6
\]

This cannot be correct, as the answer is greater than 1. In fact, the events “not green” and “not blue” are not mutually exclusive, as there are lots of balls that are true for both events.

EXERCISE 19E

Iqbal throws an ordinary dice. What is the probability that he throws these scores?

- a 2
- b 5
- c 2 or 5

Jennifer draws a card from a pack of cards. What is the probability that she draws these?

- a a Heart
- b a Club
- c a Heart or a Club

Jasper draws a card from a pack of cards. What is the probability that he draws one of the following numbers?

- a 2
- b 6
- c 2 or 6

A letter is chosen at random from the letters on these cards. What is the probability of choosing each of these?

- a a B
- b a vowel
- c a B or a vowel
A bag contains 10 white balls, 12 black balls and 8 red balls. A ball is drawn at random from the bag. What is the probability of each of these outcomes?

- a white
- b black
- c black or white
- d not red
- e not red or black

At the School Fayre the tombola stall gives out a prize if you draw from the drum a numbered ticket that ends in 0 or 5. There are 300 tickets in the drum altogether and the probability of getting a winning ticket is 0.4.

- a What is the probability of getting a losing ticket?
- b How many winning tickets are there in the drum?

John needs his calculator for his mathematics lesson. It is either in his pocket, bag or locker. The probability it is in his pocket is 0.35; the probability it is in his bag is 0.45. What is the probability that

- a he will have the calculator for the lesson?
- b it is in his locker?

A spinner has numbers and colours on it, as shown in the diagram. Their probabilities are given in the tables.

When the spinner is spun what is the probability of each of the following?

- a red or green
- b 2 or 3
- c 3 or green
- d 2 or green

- e i Explain why the answer to $P(1 \text{ or red})$ is not 0.9.
  - ii What is the answer to $P(1 \text{ or red})$?

Debbie has 20 unlabelled pirate CDs, 12 of which are rock, 5 are pop and 3 are classical. She picks a CD at random. What is the probability of these outcomes?

- a rock or pop
- b pop or classical
- c not pop

The probability that it rains on Monday is 0.5. The probability that it rains on Tuesday is 0.5 and the probability that it rains on Wednesday is 0.5. Kelly argues that it is certain to rain on Monday, Tuesday or Wednesday because $0.5 + 0.5 + 0.5 = 1.5$, which is bigger than 1 so that it is a certain event. Explain why she is wrong.
19.6 Combined events

There are many situations where two events occur together. Some examples are given below. Note that in each case all the possible outcomes of the events are shown in diagrams. These are called probability space diagrams or sample space diagrams.

**Throwing two dice**

Imagine that two dice, one red and one blue, are thrown. The red dice can land with any one of six scores: 1, 2, 3, 4, 5 or 6. The blue dice can also land with any one of six scores. This gives a total of 36 possible combinations. These are shown in the left-hand diagram, where each combination is given as (2, 3), etc. The first number is the score on the blue dice and the second number is the score on the red dice.

The combination (2, 3) gives a total score of 5. The total scores for all the combinations are shown in the right-hand diagram.

From the diagram on the right, we can see that there are two ways to get a score of 3. This gives a probability of

\[ P(3) = \frac{2}{36} = \frac{1}{18} \]

From the diagram on the left, we can see that there are six ways to get a “double”. This gives a probability of

\[ P(\text{double}) = \frac{6}{36} = \frac{1}{6} \]
Throwing coins

Throwing one coin
There are two equally likely outcomes, head or tail.

Throwing two coins together
There are four equally likely outcomes.

\[ P(2 \text{ heads}) = \frac{1}{4} \]

\[ P(\text{head and tail}) = \frac{2}{4} = \frac{1}{2} \]

Dice and coins

Throwing a dice and a coin

\[
\begin{array}{cccccc}
\text{Score on dice} & 1 & 2 & 3 & 4 & 5 & 6 \\
(1, H) & (2, H) & (3, H) & (4, H) & (5, H) & (6, H) \\
(1, T) & (2, T) & (3, T) & (4, T) & (5, T) & (6, T) \\
\end{array}
\]

\[ P(\text{head and an even number}) = \frac{3}{12} = \frac{1}{4} \]

EXERCISE 19F

To answer these questions, use the right-hand diagram on page 463 for the total scores when two dice are thrown together.

- a. What is the most likely score?
- b. Which two scores are least likely?
- c. Write down the probabilities of all scores from 2 to 12.
- d. What is the probability of each of these scores?
  - i. bigger than 10
  - ii. between 3 and 7
  - iii. even
  - iv. a square number
  - v. a prime number
  - vi. a triangular number

Using the left-hand diagram on page 463 that shows, as coordinates, the outcomes when two dice are thrown together, what is the probability of each of these?

- a. the score is an even “double”
- b. at least one of the dice shows 2
- c. the score on one dice is twice the score on the other dice
- d. at least one of the dice shows a multiple of 3

Using the left-hand diagram on page 463 that shows, as coordinates, the outcomes when two dice are thrown together, what is the probability of each of these?

a. both dice show a 6
b. at least one of the dice shows a six
c. exactly one dice shows a six

The diagram shows the score for the event “the difference between the scores when two dice are thrown”. Copy and complete the diagram.

For the event described above, what is the probability of a difference of each of these?

a. 1
c. 4
d. 6

When two coins are thrown together, what is the probability of each of these outcomes?

a. 2 heads
b. a head and a tail
c. at least 1 tail
d. no tails

Use the diagram of the outcomes when two coins are thrown together, on page 464.

Two five-sided spinners are spun together and the total score of the faces that they land on is worked out. Copy and complete this probability space diagram.

a. What is the most likely score?
b. When two five-sided spinners are spun together, what is the probability of each of these?
   i. the total score is 5
   ii. the total score is an even number
   iii. the score is a “double”
   iv. the score is less than 7

When three coins are tossed together, what is the probability of each of these outcomes?

a. three heads
b. two heads and one tail
c. at least one tail
d. no tails

When one coin is tossed there are two outcomes. When two coins are tossed, there are four outcomes. When three coins are tossed, there are eight outcomes. When n coins are tossed, there are 2^n outcomes.

a. How many outcomes will there be when four coins are tossed?
b. How many outcomes will there be when five coins are tossed?
c. How many outcomes will there be when ten coins are tossed?
d. How many outcomes will there be when n coins are tossed?
When a dice and a coin are thrown together, what is the probability of each of the following outcomes?

- You get a head on the coin and a 6 on the dice.
- You get a tail on the coin and an even number on the dice.
- You get a head on the coin and a square number on the dice.

Use the diagram on page 464 that shows the outcomes when a dice and a coin are thrown together.

Imagine we have to draw two cards from this pack of six cards, but we must replace the first card before we select the second card.

One way we could show all the outcomes of this experiment is to construct a **probability space diagram**. For example, this could be an array set in a pair of axes, like those used for the two dice (see page 463), or a pictogram, like those used for the coins, or simply a list of all the outcomes. By showing all the outcomes of our experiment as an array, we obtain the diagram below.

From the diagram, we can see immediately that the probability of picking, say, two squares is 9 out of 36 pairs of cards. So,

\[ P(2 \text{ squares}) = \frac{9}{36} = \frac{1}{4} \]
An alternative method to tackling problems involving combined events is to use a tree diagram.

When we pick the first card, there are three possible outcomes: a square, a triangle or a circle. For a single event,

\[ P(\text{square}) = \frac{1}{2} \quad P(\text{triangle}) = \frac{1}{3} \quad P(\text{circle}) = \frac{1}{6} \]

We can show this by depicting each event as a branch and writing its probability on the branch.

The diagram can then be extended to take into account a second choice. Because the first card has been replaced, we can still pick a square, a triangle or a circle. This is true no matter what is chosen the first time. We can demonstrate this by adding three more branches to the “squares” branch in the diagram.
Here is the complete tree diagram.

The probability of any outcome is calculated by multiplying together the probabilities on its branches. For instance,

\[ P(\text{two squares}) = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4} \]
\[ P(\text{triangle followed by circle}) = \frac{1}{3} \times \frac{1}{6} = \frac{1}{18} \]

**EXAMPLE 12**

Using the tree diagram above, what is the probability of obtaining each of the following?

- a two triangles
- b a circle followed by a triangle
- c a square and a triangle, in any order
- d two circles
- e two shapes the same

\[ P(\text{two triangles}) = \frac{1}{3} \]
\[ P(\text{circle followed by triangle}) = \frac{1}{18} \]

The probability of each is \( \frac{1}{3} \). Their combined probability is given by the addition rule.

\[ P(\text{square and triangle, in any order}) = \frac{1}{6} + \frac{1}{6} = \frac{1}{3} \]
A coin is tossed twice. Copy and complete the tree diagram below to show all the outcomes.

Use your tree diagram to work out the probability of each of these outcomes.

- **getting two heads**
- **getting a head and a tail**
- **getting at least one tail**

A card is drawn from a pack of cards. It is replaced, the pack is shuffled and another card is drawn.

- **What is the probability that either card was an Ace?**
- **What is the probability that either card was not an Ace?**
- **Draw a tree diagram to show the outcomes of two cards being drawn as described. Use the tree diagram to work out the probability of each of these.**
  - both cards will be Aces
  - at least one of the cards will be an Ace
On my way to work, I drive through two sets of road works with traffic lights which only show green or red. I know that the probability of the first set being green is \( \frac{1}{3} \) and the probability of the second set being green is \( \frac{1}{2} \).

a) What is the probability that the first set of lights will be red?

b) What is the probability that the second set of lights will be red?

c) Copy and complete the tree diagram below, showing the possible outcomes when passing through both sets of lights.

\[
\begin{array}{c|c|c|c}
\text{First event} & \text{Second event} & \text{Outcome} & \text{Probability} \\
\hline
G & G & (G, G) & \frac{1}{3} \times \frac{1}{2} = \frac{1}{6} \\
G & R & (G, R) & \frac{1}{3} \times \frac{1}{2} = \frac{1}{6} \\
R & G & (R, G) & \frac{1}{3} \times \frac{1}{2} = \frac{1}{6} \\
R & R & (R, R) & \frac{1}{3} \times \frac{1}{2} = \frac{1}{6} \\
\end{array}
\]

d) Using the tree diagram, what is the probability of each of the following outcomes?

i) I do not get held up at either set of lights

ii) I get held up at exactly one set of lights

iii) I get held up at least once

e) Over a school term I make 90 journeys to work. On how many days can I expect to get two green lights?

Six out of every 10 cars in Britain are foreign made.

a) What is the probability that any car will be British made?

b) Two cars can be seen approaching in the distance. Draw a tree diagram to work out the probability of each of these outcomes.

i) both cars will be British made

ii) one car will be British and the other car will be foreign made
Three coins are tossed. Complete the tree diagram below and use it to answer the questions.

<table>

If a coin is tossed three times, what is the probability that you get each of these outcomes?

a. three heads
b. two heads and a tail
c. at least one tail

Thomas has to take a three-part language examination paper. The first part is speaking. He has a 0.4 chance of passing this part. The second is listening. He has a 0.5 chance of passing this part. The third part is writing. He has a 0.7 chance of passing this part. Draw a tree diagram covering three events where the first event is passing or failing the speaking part of the examination, the second event is passing or failing the listening part, and the third event is passing or failing the writing part.

a. If he passes all three parts, his father will give him £20. What is the probability that he gets the money?
b. If he passes two parts only, he can resit the other part. What is the chance he will have to resit?
c. If he fails all three parts, he will be thrown off the course. What is the chance he is thrown off the course?

In a group of ten girls, six like the pop group Smudge and four like the pop group Mirage. Two girls are to be chosen for a pop quiz.

a. What is the probability that the first girl chosen will be a Smudge fan?
b. Draw a tree diagram to show the outcomes of choosing two girls and which pop groups they like. (Remember, once a girl has been chosen the first time she cannot be chosen again.)
c. Use your tree diagram to work out the probability of each of these.
   i. both girls chosen will like Smudge
   ii. both girls chosen will like the same group
   iii. both girls chosen will like different groups
Look at all the tree diagrams that have been drawn so far.

a. What do the probabilities across any set of branches (outlined in the diagram below) always add up to?

b. What do the final probabilities (outlined in the diagram below) always add up to?

c. You should now be able to fill in all of the missing values in the diagram.

First event  Second event  Outcome  Probability

\[
\begin{array}{ccc}
\text{(A, C)} & \frac{2}{3} \times \frac{3}{4} = \frac{3}{10} \\
\text{(A, D)} & \frac{2}{3} \times \frac{2}{3} = \frac{4}{9} \\
\text{(B, E)} & ? \times ? = \frac{1}{3} \\
\text{(B, F)} & ? \times ? \\
\end{array}
\]

If the outcome of event A does not effect the outcome of event B, then events A and B are called independent events. Most of the combined events we have looked at so far have been independent events.

It is possible to work out problems on combined events without using tree diagrams. The method explained in Example 13 is basically the same as that of a tree diagram but uses the words and and or.
EXAMPLE 13

The chance that Ashley hits a target with an arrow is $\frac{1}{4}$. He has two shots at the target. What is the probability of each of these?

a. He hits the target both times.

b. He hits the target once only.

c. He hits the target at least once.

\[ P(\text{hits both times}) = P(\text{first shot hits and second shot hits}) = \frac{1}{4} \times \frac{1}{4} = \frac{1}{16} \]

\[ P(\text{hits the target once only}) = P(\text{first hits and second misses or first misses and second hits}) = \left( \frac{1}{4} \times \frac{3}{4} \right) + \left( \frac{3}{4} \times \frac{1}{4} \right) = \frac{3}{8} \]

\[ P(\text{hits at least once}) = P(\text{both hit or one hits}) = \frac{1}{16} + \frac{3}{8} = \frac{7}{16} \]

Note the connections between the word “and” and the operation “times”, and the word “or” and the operation “add”.

EXERCISE 19H

1. Alf tosses a coin twice. The coin is biased so it has a probability of $\frac{2}{3}$ of landing on a head. What is the probability that he gets
   
   a. two heads?
   
   b. a head and a tail (in any order)?

2. Bernice draws a card from a pack of cards, replaces it, shuffles the pack and then draws another card. What is the probability that the cards are
   
   a. both Aces?
   
   b. an Ace and a King (in any order)?

3. A dice is thrown twice. What is the probability that both scores are
   
   a. even?
   
   b. one even and one odd (in any order)?

4. I throw a dice three times. What is the probability of getting three sixes?

5. A bag contains 15 white beads and 10 black beads. I take out a bead at random, replace it and take out another bead. What is the probability of each of these?
   
   a. both beads are black
   
   b. one bead is black and the other white (in any order)

6. The probability that I am late for work on Monday is 0.4. The probability that I am late on Tuesday is 0.2. What is the probability of each of the following outcomes?
   
   a. I am late for work on Monday and Tuesday.
   
   b. I am late for work on Monday and on time on Tuesday.
   
   c. I am on time on both Monday and Tuesday.
Ronda has to take a three-part language examination paper. The first part is speaking. She has a 0.7 chance of passing this part. The second part is listening. She has a 0.6 chance of passing this part. The third part is writing. She has a 0.8 chance of passing this part.

a If she passes all three parts, her father will give her £20. What is the probability that she gets the money?

b If she passes two parts only, she can resit the other part. What is the chance she will have to resit?

c If she fails all three parts, she will be thrown off the course. What is the chance she is thrown off the course?

"At least" problems

In examination questions concerning combined events, it is common to ask for the probability of at least one of the events occurring. There are two ways to solve such problems.

- All possibilities can be written out, which takes a long time.
- Use \( P(\text{at least one}) = 1 - P(\text{none}) \)

The second option is much easier to work out and there is less chance of making a mistake.

EXAMPLE 14

A bag contains seven red and three black balls. A ball is taken out and replaced. This is repeated three times. What is the probability of getting each of these?

a no red balls

b at least one red ball

\[
P(\text{no reds}) = P(\text{black, black, black}) = \frac{3}{10} \times \frac{3}{10} \times \frac{3}{10} = 0.343
\]

\[
P(\text{at least one red}) = 1 - P(\text{no reds}) = 1 - 0.343 = 0.657
\]

Note that the answer to part b is 1 minus the answer to part a. Examination questions often build up answers in this manner.

EXERCISE 19I

A dice is thrown three times.

a What is the probability of not getting a 2?

b What is the probability of at least one 2?

Four coins are thrown. What is the probability of

a 4 tails?

b at least 1 head?
Adam, Bashir and Clem take a mathematics test. The probability that Adam passes is 0.6, the probability that Bashir passes is 0.9, and the probability that Clem passes is 0.7. What is the probability of each of these outcomes?

a all three pass
b Bashir and Adam pass but Clem does not
c all three fail
d at least one passes

A bag contains 4 red and 6 blue balls. A ball is taken out and replaced. Another ball is taken out. What is the probability of each of these?

a both balls are red   b both balls are blue   c at least one is red

A dice is thrown three times. What is the probability of
i 3 sixes?   ii no sixes?   iii at least one six?

A dice is thrown four times. What is the probability of
i 4 sixes?   ii no sixes?   iii at least one six?

A dice is thrown five times. What is the probability of
i 5 sixes?   ii no sixes?   iii at least one six?

d A dice is thrown n times. What is the probability of
i n sixes?   ii no sixes?   iii at least one six?

The probability that the school canteen serves chips on any day is $\frac{2}{3}$. In a week of five days, what is the probability of each of these?

a chips are served every day
b chips are not served on any day
c chips are served on at least one day

The probability that Steve is late for work is $\frac{1}{5}$. The probability that Nigel is late for work is $\frac{9}{10}$. The probability that Gary is late for work is $\frac{1}{2}$. What is the probability that on a particular day

a all three are late?   b none of them are late?   c at least one is late?

More advanced use of and and or

We have already seen how certain probability problems can be solved either by tree diagrams or by the use of the and/or method. Both methods are basically the same but the and/or method works better in the case of three events following one another or in situations where the number of outcomes of one event is greater than two. This is simply because the tree diagram would get too large and involved.
A bag contains three black balls and seven red balls. A ball is taken out and replaced. This is repeated twice. What is the probability of each of these outcomes?

a. all three are black
b. exactly two are black
c. exactly one is black
d. none are black

Let K be the event “Drawing a King”. Let N be the event “Not drawing a King”. Then you obtain

a. \( P(KKK) = \frac{1}{13} \times \frac{1}{13} \times \frac{1}{13} = \frac{1}{2197} \)

b. \( P(\text{exactly two Kings}) = P(KKN) \) or \( P(KNK) \) or \( P(NKK) \)
   \( = \left( \frac{1}{13} \times \frac{1}{13} \times \frac{12}{13} \right) + \left( \frac{1}{13} \times \frac{12}{13} \times \frac{1}{13} \right) + \left( \frac{12}{13} \times \frac{1}{13} \times \frac{1}{13} \right) = \frac{36}{2197} \)

c. \( P(\text{no Kings}) = P(NNN) = \frac{12}{13} \times \frac{12}{13} \times \frac{12}{13} = \frac{1728}{2197} \)

d. \( P(\text{at least one King}) = 1 - P(\text{no Kings}) = 1 - \frac{1728}{2197} = \frac{469}{2197} \)

Note that in part b the notation stands for the probability that the first card is a King, the second is a King and the third is not a King; or the first is a King, the second is not a King and the third is a King; or the first is not a King, the second is a King and the third is a King.

Note also that the probability of each component of part b is exactly the same. So we could have done the calculation as

\[ 3 \times \frac{1}{13} \times \frac{1}{13} \times \frac{12}{13} = \frac{36}{2197} \]

Patterns of this kind often occur in probability.
4 Alf is late for school with a probability of 0.9. Bert is late with a probability of 0.7. Chas is late with a probability of 0.6. On any particular day what is the probability of each of these?
   a exactly one of them being late
   b exactly two of them being late

5 Daisy takes four A-levels. The probability that she will pass English is 0.7. The probability that she will pass history is 0.6. The probability she will pass geography is 0.8. The probability that she will pass general studies is 0.9. What is the probability of each of these?
   a she passes all four subjects
   b she passes exactly three subjects
   c she passes at least three subjects

6 The driving test is in two parts, a written test and a practical test. It is known that 90% of people who take the written test pass, and 60% of people who take the practical test pass. A person who passes the written test does not have to take it again. A person who fails the practical test does have to take it again.
   a What is the probability that someone passes the written test?
   b What is the probability that someone passes the practical test?
   c What is the probability that someone passes both tests?
   d What is the probability that someone passes the written test but takes two attempts to pass the practical test?

7 Six out of ten cars in Britain are made by foreign manufacturers. Three cars can be seen approaching in the distance.
   a What is the probability that the first one is foreign?
   b The first car is going so fast that its make could not be made out. What is the probability that the second car is foreign?
   c What is the probability that exactly two of the three cars are foreign?
   d Explain why, if the first car is foreign, the probability of the second car being foreign is still 6 out of 10.

8 Each day Mr Smith runs home. He has a choice of three routes: the road, the fields or the canal path. The road route is 4 miles, the fields route is 6 miles and the canal route is 5 miles. In a three-day period, what is the probability that Mr Smith runs a total distance of
   a exactly 17 miles
   b exactly 13 miles
   c exactly 15 miles
   d over 17 miles?

9 A rock climber attempts a difficult route. There are three hard moves at points A, B and C in the climb. The climber has a probability of 0.6, 0.3 and 0.7 respectively of completing each of these moves. What is the probability that the climber
   a completes the climb
   b fails at move A
   c fails at move B
   d fails at move C

The term **conditional probability** is used to describe the situation when the probability of an event is dependent on the outcome of another event. For instance, if a card is taken from a pack and not returned, then the probabilities for the next card drawn will be altered. The following example illustrates this situation.

**EXAMPLE 16**

A bag contains nine balls, of which five are white and four are black.

A ball is taken out and not replaced. Another is then taken out. If the first ball removed is black, what is the probability of each of these outcomes?

- **a** the second ball will be black
- **b** both balls will be black

When a black ball is removed, there are five white balls and three black balls left, reducing the total to eight.

Hence, when the second ball is taken out,

- **a** \( P(\text{second ball black}) = \frac{5}{8} \)
- **b** \( P(\text{both balls black}) = \frac{4}{9} \times \frac{3}{8} = \frac{1}{6} \)
I put six CDs in my multi-player and put it on random play. Each CD has 10 tracks. Once a track is played, it is not played again.

a  What is the chance that track 5 on CD 6 is the first one played?

b  What is the maximum number of tracks that could be played before a track from CD 6 is played?

There are five white and one brown eggs in an egg box. Kate decides to make a two-egg omelette. She takes each egg from the box without looking at its colour.

a  What is the probability that the first egg taken is brown?

b  If the first egg taken is brown, what is the probability that the second egg taken will be brown?

c  What is the probability that Kate gets an omelette made from each of these combinations?
   i two white eggs  ii one white and one brown egg  iii two brown eggs

A box contains 10 red and 15 yellow balls. One is taken out and not replaced. Another is taken out.

a  If the first ball taken out is red, what is the probability that the second ball is
   i red?  ii yellow?

b  If the first ball taken out is yellow, what is the probability that the second ball is
   i red?  ii yellow?

A fruit bowl contains six Granny Smith apples and eight Golden Delicious apples. Kevin takes two apples at random.

a  If the first apple is a Granny Smith, what is the probability that the second is
   i a Granny Smith?  ii a Golden Delicious?

b  What is the probability that
   i both are Granny Smiths?  ii both are Golden Delicious?

c  If the first tin is soup, what is the probability that
   i they are both soup?  ii they are both peaches?

b  What is the probability that she has to open two tins before she gets a tin of peaches?

c  What is the probability that she has to open three tins before she gets a tin of peaches?

d  What is the probability that she will get a tin of soup if she opens five tins?

One in three cars on British roads is made in Britain. A car comes down the road. It is a British-made car. John says that the probability of the next car being British made is one in two because a British-made car has just gone past. Explain why he is wrong.
CHAPTER 19: PROBABILITY

A bag contains three black balls and seven red balls. A ball is taken out and not replaced. This is repeated twice. What is the probability of each of these outcomes?

a all three are black
b exactly two are black
c exactly one is black
d none are black

One my way to work, I pass two sets of traffic lights. The probability that the first is green is \( \frac{1}{3} \). If the first is green, the probability that the second is green is \( \frac{1}{3} \). If the first is red, the probability that the second is green is \( \frac{2}{3} \). What is the probability of each of these?

a both are green
b none are green
c exactly one is green
d at least one is green

A hand of five cards is dealt. What is the probability of each of these outcomes?

a all five are Spades
b all five are the same suit
c they are four Aces and any other card
d they are four of a kind and any other card

An engineering test is in two parts, a written test and a practical test. It is known that 90% who take the written test pass. When a person passes the written test, the probability that he/she will also pass the practical test is 60%. When a person fails the written test, the probability that he/she will pass the practical test is 20%.

a What is the probability that someone passes both tests?
b What is the probability that someone passes one test?
c What is the probability that someone fails both tests?
d What is the combined probability of the answers to parts a, b, and c?

Each day Mr Smith runs home from work. He has a choice of three routes. The road, the fields or the canal path. On Monday, each route has an equal probability of being chosen. The route chosen on any day will not be picked the next day and so each of the other two routes has an equal probability of being chosen.

a Write down all the possible combinations so that Mr Smith runs home via the canal path on Wednesday (there are four of them).
b Calculate the probability that Mr Smith runs home via the canal path on Wednesday.
c Calculate the probability that Mr Smith runs home via the canal path on Tuesday.
d Using your results from parts b and c, write down the probability that Mr Smith runs home via the canal path on Thursday.
e Explain the answers to parts b, c and d.
Jacob has 2 bags of sweets.
Bag P contains 3 green sweets and 4 red sweets.
Bag Q contains 1 green sweet and 3 yellow sweets.
Jacob takes one sweet at random from each bag.

a) Copy and complete the tree diagram.

b) Calculate the probability that Jacob will take
2 green sweets.

Edexcel, Question 3, Paper 13B Higher, March 2004

Jonathan has a bag containing 10 balls. The balls
are red, green or blue. He takes a ball at random
from the bag and notes its colour. He then replaces
the ball in the bag and repeats the experiment
500 times.
The results are

<table>
<thead>
<tr>
<th>Colour</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>235</td>
</tr>
<tr>
<td>Green</td>
<td>168</td>
</tr>
<tr>
<td>Blue</td>
<td>97</td>
</tr>
</tbody>
</table>

i) What is the relative frequency of picking a red
ball?

ii) How many of each coloured ball are in the bag?

Matthew takes a ball at random from another bag
and replaces it. He does this 10 times and gets 6
reds and 4 greens. He claims that there are no blue
balls in the bag.

Explain why he could be wrong.

Julie and Pat are going to the cinema.
The probability that Julie will arrive late is 0.2.
The probability that Pat will arrive late is 0.6.
The two events are independent.
a) Copy and complete the tree diagram.

b) What is the probability that Julie and Pat will both
arrive late?

Edexcel, Question 6, Paper 13A Higher, January 2003

Arthur has a box of 10 unlabelled CDs. The CDs are
pop, classical or dance. The table shows the
probability of each type of music if a CD is taken out
at random.

<table>
<thead>
<tr>
<th>Type of music</th>
<th>Probability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pop</td>
<td>0.6</td>
</tr>
<tr>
<td>Classical</td>
<td>0.1</td>
</tr>
<tr>
<td>Dance</td>
<td></td>
</tr>
</tbody>
</table>

a) What is the probability that a CD chosen at random
is a dance CD?

b) How many classical CDs are in the box?
c) Arthur picks a CD at random and puts it in a 2-disc
CD player. He then picks another CD at random
and puts it in the player. Complete the tree diagram

d) What is the probability that neither of the CDs is
pop?

At the end of a course, army cadets have to pass an
exam to gain a certificate. The probability of passing
the exam at the first attempt is 0.65.
Those who fail are allowed to re-sit.
The probability of passing the re-sit is 0.7.
No further attempts are allowed.
a i) Complete the tree diagram.

ii) What is the probability that a cadet fails to gain
a certificate after two attempts?

b) Five cadets take the exam.
What is the probability that all of them gain a
certificate?
Jim spins a biased coin. The probability that it will land on heads is twice the probability that it will land on tails.

Jim spins the coin twice. Find the probability that it will land once on heads and once on tails.

**Edexcel, Question 6, Paper 13B Higher, January 2004**

---

A drinks machine uses cartridges to supply the drink. Billy has a job lot of eight cartridges which have lost their labels. He knows he has three teas and five coffees. He makes three drinks with the cartridges.

a What is the probability he gets three teas?

b What is the probability he gets exactly two coffees?

c What is the probability that he gets at least one coffee?

d Billy makes the three drinks and leaves the room. Betty comes in, tastes one of the drinks. She finds it is tea. What is the probability that the other two drinks are also tea?

---

**WORKED EXAM QUESTION**

The probability that Barney has a walk in the park on any day is \( \frac{3}{4} \). The probability that Barney goes for a walk in the park and goes to the café \( \frac{3}{16} \).

a One day Barney goes to the park. Calculate the probability that he goes to the café.

b Calculate the probability that Barney goes to the park and does not go to the café.

---

**Solution**

1. **Draw the part of the probability tree that you know about.**
2. **Set up an equation.**
3. **Substitute in the probabilities and solve the equation. Remember to turn the fraction upside down and multiply by it when you divide.**
4. **First work out the probability of the complementary event then use the ‘and’ rule for combined events.**

---

**CHAPTER 19: PROBABILITY**

- **Edexcel, Question 6, Paper 13B Higher, January 2004**

---

GRADE YOURSELF

- Able to calculate the probability of an event happening when you know the probability that the event does not happen and that the total probability of all possible outcomes is 1
- Able to predict the expected number of successes from a given number of trials if you know the probability of one success
- Able to calculate relative frequency from experimental evidence and compare this with the theoretical probability
- Able to draw a tree diagram to work out the probability of combined events
- Able to use and/or or a tree diagram to work out probabilities of specific outcomes of combined events
- Able to work out the probabilities of combined events when the probability of each event changes depending on the outcome of the previous event

What you should know now

- How to calculate theoretical probabilities from different situations
This chapter will show you ...

- how to combine fractions algebraically and solve equations with algebraic fractions
- how to solve linear and non-linear simultaneous equations
- some of the common sequences of numbers
- how to express a rule for a sequence in words and algebraically
- how to transpose a formula where the subject appears twice

What you should already know

- How to state a rule for a simple linear sequence in words
- How to substitute numbers into an algebraic expression
- How to factorise simple linear expressions
- How to expand a pair of linear brackets to get a quadratic equation

Quick check

1. Write down the next three terms of these sequences.
   - a 2, 5, 8, 11, 14, ...
   - b 1, 3, 6, 10, 15, 21, ...
   - c 40, 35, 30, 25, 20, ...
   - d 1, 4, 9, 16, 25, 36, ...

2. Work out the value of the expression $3n - 2$ for
   - a $n = 1$
   - b $n = 2$
   - c $n = 3$

3. Factorise
   - a $2x + 6$
   - b $x^2 - x$
   - c $10x^2 + 2x$

4. Expand
   - a $(x + 6)(x + 2)$
   - b $(2x + 1)(x - 3)$
   - c $(x - 2)^2$

5. Make $x$ the subject of
   - a $2y + x = 3$
   - b $x - 3y = 4$
   - c $4y - x = 3$
The following four identities are used to work out the value of fractions. An identity is a rule that is true for any values. The sign ‘≡’ is used to show an identity.

Addition: \( \frac{a}{b} + \frac{c}{d} = \frac{ad + bc}{bd} \)

Subtraction: \( \frac{a}{b} - \frac{c}{d} = \frac{ad - bc}{bd} \)

Multiplication: \( \frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd} \)

Division: \( \frac{a}{b} \div \frac{c}{d} = \frac{ad}{bc} \)

Note that \( a, b, c \) and \( d \) can be numbers, other letters or algebraic expressions. Remember:

- use brackets, if necessary
- factorise if you can
- cancel if you can.

**EXAMPLE 1**

Simplify \( a \frac{1}{x} + \frac{x}{2y} \) and \( b \frac{2}{b} - \frac{a}{2b} \)

**a** Using the addition rule:

\[
\frac{1}{x} + \frac{x}{2y} = \frac{(1)(2y) + (x)(x)}{(x)(2y)} = \frac{2y + x^2}{2xy}
\]

**b** Using the subtraction rule:

\[
\frac{2}{b} - \frac{a}{2b} = \frac{(2)(2b) - (a)(b)}{(b)(2b)} = \frac{4b - ab}{2b^2}
\]

\[
= \frac{b(4 - a)}{2b^2} = \frac{4 - a}{2b}
\]

**Note:** There are different ways of working out fraction calculations. Part **b** could have been done by making the denominator of each fraction the same. Namely.

\[
(2)\frac{2}{2b} - \frac{a}{2b} = \frac{4 - a}{2b}
\]
EXAMPLE 2

Simplify \( a \frac{x}{3} \times \frac{x + 2}{x - 2} \) \( b \frac{x}{3} = \frac{2x}{7} \)

a Using the multiplication rule: \( \frac{x}{3} \times \frac{x + 2}{x - 2} = \frac{(x)(x + 2)}{(3)(x - 2)} = \frac{x^2 + 2x}{3x - 6} \)

Remember that the line that separates the top from the bottom of an algebraic fraction acts as a bracket as well as a divide sign. Note that it is sometimes preferable to leave an algebraic fraction in a factorised form.

b Using the division rule: \( \frac{x}{3} = \frac{2x}{7} = \frac{(7)(x)}{(3)(2x)} = \frac{7}{6} \)

EXAMPLE 3

Solve this equation. \( \frac{x + 1}{3} - \frac{x - 3}{2} = 1 \)

Use the rule for combining fractions, and also cross-multiply the denominator of the left-hand side to the right-hand side.

\[
\frac{(2)(x + 1) - (3)(x - 3)}{(2)(3)} = 1
\]

\[2(x + 1) - 3(x - 3) = 6 \quad (= 1 \times 2 \times 3)\]

Note the brackets. These will avoid problems with signs and help you to expand to get a linear equation.

\[2x + 2 - 3x + 9 = 6 \quad \Rightarrow \quad -x = -5 \quad \Rightarrow \quad x = 5\]

EXAMPLE 4

Solve this equation. \( \frac{3}{x - 1} - \frac{2}{x + 1} = 1 \)

Use the rule for combining fractions, and cross multiply the denominator as in Example 3.

Use brackets to help with expanding and to avoid problems with minus signs.

\[3(x + 1) - 2(x - 1) = (x - 1)(x + 1)\]

\[3x + 3 - 2x + 2 = x^2 - 1 \quad \text{(Right-hand side is the difference of two squares.)}\]

Rearrange into the general quadratic form (see Chapter 12).

\[x^2 - x - 6 = 0\]

Factorise and solve \( (x - 3)(x + 2) = 0 \quad \Rightarrow \quad x = 3 \text{ or } -2 \)

Note that when your equation is rearranged into the quadratic form it should factorise. If it doesn't, then you have almost certainly made a mistake. If the question required an answer as a decimal or a surd it would say so.
CHAPTER 20: ALGEBRA 3

EXAMPLE 5

Simplify: \( \frac{2x^2 + x - 3}{4x^2 - 9} \)

Factorise the numerator and denominator: \( \frac{(2x + 3)(x-1)}{(2x + 3)(2x - 3)} \)

Denominator is the difference of two squares.

Cancel any common factors: \( \frac{(x-1)}{(2x - 3)} \)

If at this stage there isn’t a common factor on top and bottom, you should check your factorisations.

Remaining term is the answer: \( \frac{(x-1)}{(2x - 3)} \)

EXERCISE 20A

1. Simplify each of these.
   
   a. \( \frac{x}{2} + \frac{x}{3} \)
   b. \( \frac{3x}{4} + \frac{x}{5} \)
   c. \( \frac{3x}{4} + \frac{2x}{5} \)
   d. \( \frac{x}{2} + \frac{y}{3} \)
   e. \( \frac{xy}{4} + \frac{2}{y} \)
   f. \( \frac{x+1}{2} + \frac{x+2}{3} \)
   g. \( \frac{2x-1}{2} + \frac{3x-1}{4} \)
   h. \( \frac{x}{5} + \frac{2x-1}{3} \)
   i. \( \frac{x-2}{2} + \frac{x+3}{4} \)
   j. \( \frac{x-4}{5} + \frac{2x-3}{2} \)

2. Simplify each of these.
   
   a. \( \frac{x}{2} - \frac{x}{3} \)
   b. \( \frac{3x}{4} - \frac{x}{5} \)
   c. \( \frac{3x}{4} - \frac{2x}{5} \)
   d. \( \frac{x}{2} - \frac{y}{3} \)
   e. \( \frac{xy}{4} - \frac{2}{y} \)
   f. \( \frac{x+1}{2} - \frac{x+2}{3} \)
   g. \( \frac{2x+1}{2} - \frac{3x+3}{4} \)
   h. \( \frac{x}{5} - \frac{2x+1}{3} \)
   i. \( \frac{x-2}{2} - \frac{x-3}{4} \)
   j. \( \frac{x-4}{5} - \frac{2x-3}{2} \)

3. Solve the following equations.
   
   a. \( \frac{x+1}{2} + \frac{x+2}{5} = 3 \)
   b. \( \frac{x+2}{4} + \frac{x+1}{7} = 3 \)
   c. \( \frac{4x+1}{3} - \frac{x+2}{4} = 2 \)
   d. \( \frac{2x-1}{3} + \frac{3x+1}{4} = 7 \)
   e. \( \frac{2x+1}{2} - \frac{x+1}{7} = 1 \)
   f. \( \frac{3x+1}{5} - \frac{5x-1}{7} = 0 \)
4 Simplify each of these.

\[
\begin{align*}
\text{a} & \quad \frac{x}{2} \times \frac{x}{3} \\
\text{b} & \quad \frac{2x}{7} \times \frac{3y}{4} \\
\text{c} & \quad \frac{4x}{3y} \times \frac{2y}{x} \\
\text{d} & \quad \frac{4y^2}{9x} \times \frac{3x^2}{2y} \\
\text{e} & \quad \frac{x}{2} \times \frac{x-2}{5} \\
\text{f} & \quad \frac{x-3}{15} \times \frac{5}{2x-6} \\
\text{g} & \quad \frac{2x+1}{2} \times \frac{3x+1}{4} \\
\text{h} & \quad \frac{x}{5} \times \frac{2x+1}{3} \\
\text{i} & \quad \frac{x-2}{2} \times \frac{4}{x-3} \\
\text{j} & \quad \frac{x-5}{10} \times \frac{5}{x^2-5x}
\end{align*}
\]

5 Simplify each of these.

\[
\begin{align*}
\text{a} & \quad \frac{x}{2} \div \frac{x}{3} \\
\text{b} & \quad \frac{2x}{7} \div \frac{4y}{14} \\
\text{c} & \quad \frac{4x}{3y} \div \frac{x}{2y} \\
\text{d} & \quad \frac{4y^2}{9x} \div \frac{2y}{3x^2} \\
\text{e} & \quad \frac{x}{2} \div \frac{x-2}{5} \\
\text{f} & \quad \frac{x-3}{15} \div \frac{5}{2x-6} \\
\text{g} & \quad \frac{2x+1}{2} \div \frac{4x+2}{4} \\
\text{h} & \quad \frac{x}{6} \div \frac{2x^2+x}{3} \\
\text{i} & \quad \frac{x-2}{12} \div \frac{4}{x-3} \\
\text{j} & \quad \frac{x-5}{10} \div \frac{x^2-5x}{5}
\end{align*}
\]

6 Simplify each of these. Factorise and cancel where appropriate.

\[
\begin{align*}
\text{a} & \quad \frac{3x}{4} + \frac{x}{4} \\
\text{b} & \quad \frac{3x}{4} - \frac{x}{4} \\
\text{c} & \quad \frac{3x}{4} \times \frac{x}{4} \\
\text{d} & \quad \frac{3x}{4} - \frac{x}{4} \\
\text{e} & \quad \frac{3x+1}{2} + \frac{x-2}{5} \\
\text{f} & \quad \frac{3x+1}{2} - \frac{x-2}{5} \\
\text{g} & \quad \frac{3x+1}{2} \times \frac{x-2}{5} \\
\text{h} & \quad \frac{x^2-9}{10} \times \frac{5}{x-3} \\
\text{i} & \quad \frac{2x+3}{5} \div \frac{6x+9}{10}
\end{align*}
\]

7 Show that each algebraic fraction simplifies to the given expression.

\[
\begin{align*}
\text{a} & \quad \frac{2}{x+1} + \frac{5}{x+2} = 3 \quad \text{simplifies to} \quad 3x^2 + 2x - 3 = 0 \\
\text{b} & \quad \frac{4}{x-2} + \frac{7}{x+1} = 3 \quad \text{simplifies to} \quad 3x^2 - 14x + 4 = 0 \\
\text{c} & \quad \frac{3}{4x+1} - \frac{4}{x+2} = 2 \quad \text{simplifies to} \quad 8x^2 + 31x + 2 = 0 \\
\text{d} & \quad \frac{2}{2x-1} - \frac{6}{x+1} = 11 \quad \text{simplifies to} \quad 22x^2 + 21x - 19 = 0 \\
\text{e} & \quad \frac{3}{2x-1} - \frac{4}{3x-1} = 1 \quad \text{simplifies to} \quad x^2 - x = 0
\end{align*}
\]
Solve the following equations.

a. \( \frac{4}{x + 1} + \frac{5}{x + 2} = 2 \)

b. \( \frac{18}{4x - 1} - \frac{1}{x + 1} = 1 \)

c. \( \frac{2x - 1}{2} - \frac{6}{x + 1} = 1 \)

d. \( \frac{3}{2x - 1} - \frac{4}{3x - 1} = 1 \)

Simplify the following expressions.

a. \( \frac{x^2 + 2x - 3}{2x^2 + 7x + 3} \)

b. \( \frac{4x^2 - 1}{2x^2 + 5x - 3} \)

c. \( \frac{6x^2 + x - 2}{9x^2 - 4} \)

d. \( \frac{4x^2 + x - 3}{4x^2 - 7x + 3} \)

e. \( \frac{4x^2 - 25}{8x^2 - 22x + 5} \)

20.2 Linear and non-linear simultaneous equations

In this section you will learn how to:

- solve linear and non-linear simultaneous equations

Key words

linear  non-linear  substitute

You have already seen the method of substitution for solving linear simultaneous equations (see page 98). Example 6 is a reminder.

Example 6

Solve these simultaneous equations.

\( 2x + 3y = 7 \) \hspace{0.5cm} (1)
\( x - 4y = 9 \) \hspace{0.5cm} (2)

First, rearrange equation (2) to obtain:
\( x = 9 + 4y \)

Substitute the expression for \( x \) into equation (1), which gives:
\( 2(9 + 4y) + 3y = 7 \)

Expand and solve this equation to obtain:
\( 18 + 8y + 3y = 7 \)
\( \Rightarrow 11y = -11 \)
\( \Rightarrow y = -1 \)

Now substitute \( y \) into either equation (1) or (2) to find \( x \). Using equation (1), we have
\( \Rightarrow 2x - 3 = 7 \)
\( \Rightarrow x = 5 \)
We can use a similar method when we need to solve a pair of equations, one of which is linear and the other of which is non-linear. But we must always substitute from the linear into the non-linear.

**Example 7**

Solve these simultaneous equations.

\[ x^2 + y^2 = 5 \]
\[ x + y = 3 \]

Call the equations (1) and (2):

\[ x^2 + y^2 = 5 \hspace{10pt} (1) \]
\[ x + y = 3 \hspace{10pt} (2) \]

Rearrange equation (2) to obtain:

\[ x = 3 - y \]

Substitute this into equation (1), which gives:

\[ (3 - y)^2 + y^2 = 5 \]

Expand and rearrange into the general form of the quadratic equation:

\[ 9 - 6y + y^2 + y^2 = 5 \]
\[ 2y^2 - 6y + 4 = 0 \]

Cancel by 2:

\[ y^2 - 3y + 2 = 0 \]

Factorise:

\[ (y - 1)(y - 2) = 0 \]
\[ \Rightarrow y = 1 \text{ or } 2 \]

Substitute for \( y \) in equation (2):

When \( y = 1, x = 2 \); and when \( y = 2, x = 1 \).

Note you should always give answers as a pair of values in \( x \) and \( y \).

**Exercise 20B**

1. Solve these pairs of linear simultaneous equations using the substitution method.
   - \( a \) \[ 2x + y = 9 \]
     \[ x - 2y = 7 \]
   - \( b \) \[ 3x - 2y = 10 \]
     \[ 4x + y = 17 \]
   - \( c \) \[ x - 2y = 10 \]
     \[ 2x + 3y = 13 \]

2. Solve these pairs of simultaneous equations.
   - \( a \) \[ xy = 2 \]
     \[ y = x + 1 \]
   - \( b \) \[ xy = -4 \]
     \[ 2y = x + 6 \]

Solve these pairs of simultaneous equations.

1. \(a\) \(x^2 + y^2 = 25\)
   \(x + y = 7\)

2. \(b\) \(x^2 + y^2 = 9\)
   \(y = x + 3\)

3. \(c\) \(x^2 + y^2 = 13\)
   \(5y + x = 13\)

Solve these pairs of simultaneous equations.

4. \(a\) \(y = x^2 + 2x - 3\)
   \(y = 2x + 1\)

5. \(b\) \(y = x^2 - 2x - 5\)
   \(y = x - 1\)

6. \(c\) \(y = x^2 - 2x\)
   \(y = 2x - 3\)

What is the geometrical significance of the answers to parts \(a\) and \(b\)?

---

### Number sequences

In this section you will learn how to:
- recognise how number sequences are built up
- find the \(n\)th term of a sequence
- recognise some special sequences

A number sequence is an ordered set of numbers with a rule to find every number in the sequence. The rule which takes you from one number to the next could be a simple addition or multiplication, but often it is more tricky than that. So you need to look most carefully at the pattern of a sequence.

Each number in a sequence is called a term and is in a certain position in the sequence.

Look at these sequences and their rules.

1. \(3, 6, 12, 24, \ldots\) doubling the last term each time \(\ldots\) \(48, 96, \ldots\)
2. \(2, 5, 8, 11, \ldots\) adding 3 to the last term each time \(\ldots\) \(14, 17, \ldots\)
3. \(1, 10, 100, 1000, \ldots\) multiplying the last term by 10 each time \(\ldots\) \(10 000, 100 000, \ldots\)
4. \(1, 8, 15, 22, \ldots\) adding 7 to the last term each time \(\ldots\) \(29, 36, \ldots\)

These are all quite straightforward once you have looked for the link from one term to the next (consecutive terms).
**Differences**

For some sequences we need to look at the differences between consecutive terms to determine the pattern.

**EXAMPLE 8**

Find the next two terms of the sequence 1, 3, 6, 10, 15, …

Looking at the differences between each pair of consecutive terms, we notice:

\[
\begin{array}{cccc}
1 & 3 & 6 & 10 & 15 \\
\uparrow & \uparrow & \uparrow & \uparrow & \\
2 & 3 & 4 & 5 & \\
\end{array}
\]

So, we can continue the sequence as follows:

\[
\begin{array}{cccccccc}
1 & 3 & 6 & 10 & 15 & 21 & 28 \\
\uparrow & \uparrow & \uparrow & \uparrow & \uparrow & \uparrow & \\
2 & 3 & 4 & 5 & 6 & 7 & \\
\end{array}
\]

The differences usually form a number sequence of their own, so you need to find out the sequence of the differences before you can expand the original sequence.

**Generalising to find the rule**

When using a number sequence, we sometimes need to know, say, its 50th term, or even a later term in the sequence. To do so, we need to find the rule which produces the sequence in its general form.

Let’s first look at the problem backwards. That is, we’ll take a rule and see how it produces a sequence.

**EXAMPLE 9**

A sequence is formed by the rule $3n + 1$, where $n = 1, 2, 3, 4, 5, 6, …$. Write down the first five terms of the sequence.

Substituting $n = 1, 2, 3, 4, 5$ in turn, we get:

\[
(3 \times 1 + 1), (3 \times 2 + 1), (3 \times 3 + 1), (3 \times 4 + 1), (3 \times 5 + 1), \ldots
\]

\[
4 \quad 7 \quad 10 \quad 13 \quad 16 \\
\]

So the sequence is 4, 7, 10, 13, 16, …

Notice that the difference between each term and the next is always 3, which is the coefficient of $n$ (the number attached to $n$). The constant term is the difference between the first term and the coefficient (in this case, 4 – 3 = 1).
Look carefully at each number sequence below. Find the next two numbers in the sequence and try to explain the pattern.

a 1, 2, 3, 5, 8, 13, …

b 1, 4, 9, 16, 25, 36, …

c 3, 4, 7, 11, 18, 29, …

Triangular numbers are found as follows.

Find the next four triangular numbers.

Hexagonal numbers are found as follows.

Find the next three hexagonal numbers.

The first two terms of the sequence of fractions \( \frac{n-1}{n+1} \) are:

\( n = 1; \quad \frac{1-1}{1+1} = \frac{0}{2} = 0 \)  \( n = 2; \quad \frac{2-1}{2+1} = \frac{1}{3} \)

Work out the next five terms of the sequence.
A sequence is formed by the rule $\frac{1}{2} \times n \times (n + 1)$ for $n = 1, 2, 3, 4, \ldots$

The first term is given by $n = 1$: $\frac{1}{2} \times 1 \times (1 + 1) = 1$

The second term is given by $n = 2$: $\frac{1}{2} \times 2 \times (2 + 1) = 3$

a. Work out the next five terms of this sequence.

b. This is a well-known sequence you have met before. What is it?

5! means “factorial 5”, which is $5 \times 4 \times 3 \times 2 \times 1 = 120$

In the same way 7! means $7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 5040$

a. Calculate 2!, 3!, 4!, and 6!

b. If your calculator has a factorial button, check that it gives the same answers as you get for part a. What is the largest factorial you can work out with your calculator before you get an error?

### Finding the $n$th term of a linear sequence

A linear sequence has the *same difference* between each term and the next.

For example:

2, 5, 8, 11, 14, ... difference of 3

The $n$th term of this sequence is given by $3n - 1$.

Here is another linear sequence:

5, 7, 9, 11, 13, ... difference of 2

The $n$th term of this sequence is given by $2n + 3$.

So, you can see that the $n$th term of a linear sequence is always of the form $An + b$, where:

- $A$, the coefficient of $n$, is the difference between each term and the next term (consecutive terms)
- $b$ is the difference between the first term and $A$.

#### Example 11

Find the $n$th term of the sequence 5, 7, 9, 11, 13, ...

The difference between consecutive terms is 2. So the first part of the $n$th term is $2n$.

Subtract the difference, 2, from the first term, 5, which gives $5 - 2 = 3$.

So the $n$th term is given by $2n + 3$.

(You can test it by substituting $n = 1, 2, 3, 4, \ldots$)
Special sequences
There are some number sequences that occur frequently. It is useful to know these as they are very likely to occur in examinations.

Even numbers
The even numbers are 2, 4, 6, 8, 10, 12, ..... 

Odd numbers
The odd numbers are 1, 3, 5, 7, 9, 11, ..... 

Square numbers
The square numbers are 1, 4, 9, 16, 25, 36, .....
Triangular numbers

The triangular numbers are 1, 3, 6, 10, 15, 21, ...

The $n$th term of this sequence is $\frac{1}{2}n(n + 1)$

Powers of 2

The powers of 2 are 2, 4, 8, 16, 32, 64, ....

The $n$th term of this sequence is $2^n$

Powers of 10

The powers of 10 are 10, 100, 1000, 10 000, 100 000, 1 000 000, ....

The $n$th term of this sequence is $10^n$

Prime numbers

The first 20 prime numbers are 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, 59, 61, 67, 71

A prime number is a number that only has two factors, 1 and itself.

There is no pattern to the prime numbers so they do not have an $n$th term.

One important fact that you should remember is that there is only one even prime number, 2.

EXERCISE 20D ➔ ANSWERS

Find the next two terms and the $n$th term in each of these linear sequences.

- **a** 3, 5, 7, 9, 11, ...
- **b** 5, 9, 13, 17, 21, ...
- **c** 8, 13, 18, 23, 28, ...
- **d** 2, 8, 14, 20, 26, ...
- **e** 5, 8, 11, 14, 17, ...
- **f** 2, 9, 16, 23, 30, ...
- **g** 1, 5, 9, 13, 17, ...
- **h** 3, 7, 11, 15, 19, ...
- **i** 2, 5, 8, 11, 14, ...
- **j** 2, 12, 22, 32, ...
- **k** 8, 12, 16, 20, ...
- **l** 4, 9, 14, 19, 24, ...

Find the $n$th term and the 50th term in each of these linear sequences.

- **a** 4, 7, 10, 13, 16, ...
- **b** 7, 9, 11, 13, 15, ...
- **c** 3, 8, 13, 18, 23, ...
- **d** 1, 5, 9, 13, 17, ...
- **e** 2, 10, 18, 26, ...
- **f** 5, 6, 7, 8, 9, ...
- **g** 6, 11, 16, 21, 26, ...
- **h** 3, 11, 19, 27, 35, ...
- **i** 1, 4, 7, 10, 13, ...
- **j** 21, 24, 27, 30, 33, ...
- **k** 12, 19, 26, 33, 40, ...
- **l** 1, 9, 17, 25, 33, ...

a Which term of the sequence 5, 8, 11, 14, 17, ... is the first one to be greater than 100?

b Which term of the sequence 1, 8, 15, 22, 29, ... is the first one to be greater than 200?

c Which term of the sequence 4, 9, 14, 19, 24, ... is the closest to 500?

For each sequence a to j, find

i the nth term
ii the 100th term
iii the term closest to 100.

a 5, 9, 13, 17, 21, ...
b 3, 5, 7, 9, 11, 13, ...
c 4, 7, 10, 13, 16, ...
d 8, 10, 12, 14, 16, ...
e 9, 13, 17, 21, ...
f 6, 11, 16, 21, ...
g 0, 3, 6, 9, 12, ...
h 2, 8, 14, 20, 26, ...
i 7, 15, 23, 31, ...
j 25, 27, 29, 31, ...

A sequence of fractions is $\frac{1}{2}$, $\frac{3}{4}$, $\frac{5}{6}$, $\frac{7}{8}$, $\frac{9}{10}$, ...

a Find the nth term in the sequence.

b By changing each fraction to a decimal, can you see a pattern?

c What, as a decimal, will be the value of the

i 100th term?

ii 1000th term?

d Use your answers to part c to predict what the 10 000th term and the millionth term are. (Check these out on your calculator.)

Repeat question 5 for $\frac{1}{3}$, $\frac{2}{7}$, $\frac{3}{17}$, $\frac{4}{27}$, $\frac{5}{37}$, ...

The powers of 2 are $2^1$, $2^2$, $2^3$, $2^4$, $2^5$, ...

This gives the sequence 2, 4, 8, 16, 32, ...

The nth term is given by $2^n$.

a Continue the sequence for another five terms.

b Give the nth term of these sequences.

i 1, 3, 7, 15, 31, ...

ii 3, 5, 9, 17, 33, ...

iii 6, 12, 24, 48, 96, ...

The powers of 10 are $10^1$, $10^2$, $10^3$, $10^4$, $10^5$, ...

This gives the sequence 10, 100, 1000, 10 000, 100 000, ...

The nth term is given by $10^n$.

a Describe the connection between the numbers of zeros in each term and the power of the term.

b If $10^n = 1000000$, what is the value of n?
Give the \( n \)th term of these sequences.

i 9, 99, 999, 9999, ...

ii 20, 200, 2000, 20000, ...

7. **Pick any odd number.**
   - Pick any other odd number.
   - Add the two numbers together. Is the answer odd or even?
   - Complete this table.

<table>
<thead>
<tr>

The square numbers are 1, 4, 9, 16, 25, ...

The \( n \)th term of this sequence is \( n^2 \).

9. **Continue the sequence for another five terms.**

10. **Give the \( n \)th term of these sequences.**

   i 2, 5, 10, 17, 26, ...

   ii 2, 8, 18, 32, 50, ...

   iii 0, 3, 8, 15, 24, ...

Write down the next two lines of this number pattern.

\[1 = 1 = 1^2\]
\[1 + 3 = 4 = 2^2\]
\[1 + 3 + 5 = 9 = 3^2\]

The triangular numbers are 1, 3, 6, 10, 15, 21, ...

11. **Continue the sequence for another four terms.**
b. The \( n \)th term of this sequence is given by \( \frac{1}{2}n(n + 1) \).

Use the formula to find:

i. The 20th triangular number

ii. The 100th triangular number

\( c \) Add consecutive terms of the triangular number sequence.

For example, \( 1 + 3 = 4 \), \( 3 + 6 = 9 \), etc.

What do you notice?

\( p \) is an odd number, \( q \) is an even number. State if the following are odd or even.

\( a \) \( p + 1 \)  
\( b \) \( q + 1 \)  
\( c \) \( p + q \)  
\( d \) \( p^2 \)  
\( e \) \( qp + 1 \)  
\( f \) \( (p + q)(p - q) \)  
\( g \) \( q^2 + 4 \)  
\( h \) \( p^2 + q^2 \)  
\( i \) \( p^3 \)  

\( p \) is a prime number, \( q \) is an even number.

State if the following are odd or even, or could be either odd or even.

\( a \) \( p + 1 \)  
\( b \) \( p + q \)  
\( c \) \( p^2 \)  
\( d \) \( qp + 1 \)  
\( e \) \( (p + q)(p - q) \)  
\( f \) \( 2p + 3q \)  

Many problem-solving situations that you are likely to meet involve number sequences. So you need to be able to formulate general rules from given number patterns.
EXAMPLE 14

The diagram shows a pattern of squares building up.

a How many squares will be on the base of the $n$th pattern?

b Which pattern has 99 squares in its base?

a First, we build up the following table for the patterns.

<table>
<thead>
<tr>
<th>Pattern number</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of squares in base</td>
<td>1</td>
<td>3</td>
<td>5</td>
<td>7</td>
<td>9</td>
</tr>
</tbody>
</table>

Looking at the difference between consecutive patterns, we see it is always two squares. So, we use $2n$.

Subtract the difference 2 from the first number, which gives $1 - 2 = -1$.

So the number of squares on the base of the $n$th pattern is $2n - 1$.

b We have to find $n$ when $2n - 1 = 99$:

$2n - 1 = 99$

$2n = 99 + 1 = 100$

$n = 100 - 2 = 50$

The pattern with 99 squares in its base is the 50th.

EXERCISE 20E

A pattern of squares is built up from matchsticks as shown.

- Draw the 4th diagram.
- How many squares are in the $n$th diagram?
- How many squares are in the 25th diagram?
- With 200 squares, which is the biggest diagram that could be made?
A pattern of triangles is built up from matchsticks.

a. Draw the 5th set of triangles in this pattern.

b. How many matchsticks are needed for the nth set of triangles?

c. How many matchsticks are needed to make the 60th set of triangles?

d. If there are only 100 matchsticks, which is the largest set of triangles that could be made?

A conference centre had tables each of which could sit six people. When put together, the tables could seat people as shown.

a. How many people could be seated at four tables put together this way?

b. How many people could be seated at n tables put together in this way?

c. A conference had 50 people who wished to use the tables in this way. How many tables would they need?

Prepacked fencing units come in the shape shown on the right, made of four pieces of wood. When you put them together in stages to make a fence, you also need joining pieces, so the fence will start to build up as shown below.

a. How many pieces of wood would you have in a fence made up in:
   i. five stages
   ii. n stages
   iii. 45 stages?

b. I made a fence out of 124 pieces of wood. How many stages did I use?

Regular pentagons of side length 1 cm are joined together to make a pattern as shown.

Copy this pattern and write down the perimeter of each shape.

a. What is the perimeter of patterns like this made from
   i. six pentagons?
   ii. n pentagons?
   iii. 50 pentagons?

b. What is the largest number of pentagons that can be put together like this to have a perimeter less than 1000 cm?
Lamp-posts are put at the end of every 100 m stretch of a motorway, as shown.

*a* How many lamp-posts are needed for

i. 900 m of this motorway?

ii. 8 km of this motorway?

*b* The M99 is a motorway being built. The contractor has ordered 1598 lamp-posts. How long is this motorway?

A school dining hall had tables in the shape of a trapezium. Each table could seat five people, as shown on the right. When the tables were joined together as shown below, each table could not seat as many people.

*a* In this arrangement, how many could be seated if there were:

i. four tables?

ii. \( n \) tables?

iii. 13 tables?

*b* For an outside charity event, up to 200 people had to be seated. How many tables arranged like this did they need?

When setting out tins to make a display of a certain height, you need to know how many tins to start with at the bottom.

*a* How many tins are needed on the bottom if you wish the display to be:

i. five tins high?

ii. \( n \) tins high?

iii. 18 tins high?

*b* I saw a shop assistant starting to build a display, and noticed he was starting with 20 tins on the bottom. How high was the display when it was finished?

The values of 2 raised to a positive whole-number power are 2, 4, 8, 16, 32, …

What is the \( n \)th term of this sequence?

*b* A supermarket sells four different sized bottles of water: pocket size, 100 ml; standard size, 200 ml; family size, 400 ml; giant size, 800 ml.

i. Describe the number pattern that the contents follow.

ii. The supermarket introduces a super giant size, which is the next sized bottle in the pattern. How much does this bottle hold?
Some problem-solving situations involve number sequences which are governed by a quadratic rule. You can always identify a pattern as being quadratic from its second differences, which are constant. (A second difference is the result of subtracting one difference between consecutive terms from the next difference.) Quadratic sequences are not assessed directly on the exam paper but occur in coursework.

**The simpler rules**

These sequences will nearly always be based on $n^2$ alone. So you do need to recognise the pattern 1, 4, 9, 16, 25, … .

The differences between consecutive terms of this pattern are the odd numbers 3, 5, 7, 9, … . So if you find that the differences form an odd-number sequence, you know the pattern is based on $n^2$.

**EXAMPLE 15**

Find the $n$th term in the sequence 2, 5, 10, 17, 26, … .

The differences are the odd numbers 3, 5, 7, 9, … so we know the rule is based on $n^2$.

The second differences are 2, a constant.

Next, we look for a link with the square numbers. We do this by subtracting from each term the corresponding square number:

<table>
<thead>
<tr>
<th>2</th>
<th>5</th>
<th>10</th>
<th>17</th>
<th>26</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1</td>
<td>-4</td>
<td>-9</td>
<td>-16</td>
<td>-25</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Clearly, the link is +1, so the $n$th term is $n^2 + 1$.

(You should always quickly check the generalisation by substituting $n = 1, 2, 3, 4$ to see whether it does work.)

**EXAMPLE 16**

Find the $n$th term in the sequence 1, 6, 13, 22, 33, … .

The differences are 5, 7, 9, 11, … so we know the pattern is based on $n^2$.

The second differences are 2, a constant.

Next, we have to find the link. We notice that the first difference is 5 not 3, which means that the series of square numbers we use starts at 4, not at 1.

It follows that to obtain 4, 9, 16, 25, … from the original sequence simply add 3 to each term of that sequence.

So to get from the square numbers to the sequence 1, 6, 13, 22, 33, … we have to use $(n + 1)^2$, since the sequence is based on 4, 9, 16, … .

The final step in finding the rule is to take away the 3, which gives the $n$th term as $(n + 1)^2 - 3$. 

More complicated rules

**EXAMPLE 17**

Find the \(n\)th term in the sequence 2, 6, 12, 20, 30, …

Looking at the differences tells us that the sequence is non-linear and is not based on \(n^2\).

So we split each term into factors to see whether we can find a pattern which shows how the numbers have been formed. Constructing a table like the one below can help us to sort out which factors to use when we have a choice.

<table>
<thead>
<tr>
<th>Term</th>
<th>Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>1 (\times) 2</td>
</tr>
<tr>
<td>6</td>
<td>2 (\times) 3</td>
</tr>
<tr>
<td>12</td>
<td>3 (\times) 4</td>
</tr>
<tr>
<td>20</td>
<td>4 (\times) 5</td>
</tr>
<tr>
<td>30</td>
<td>5 (\times) 6</td>
</tr>
</tbody>
</table>

We can break down the factors to obtain:

\[1 \times (1 + 1) \quad 2 \times (2 + 1) \quad 3 \times (3 + 1) \quad 4 \times (4 + 1) \quad 5 \times (5 + 1)\]

We can now see quite easily that the pattern is \(n \times (n + 1)\). That is the \(n\)th term is \(n(n + 1)\).

**EXAMPLE 18**

Find the \(n\)th term in the sequence of the triangular numbers 1, 3, 6, 10, 15, …

Looking at the differences tells us that the sequence is non-linear and is not based on \(n^2\).

So we split each term into factors and construct a table. (We have no problem with the choice of factors.)

<table>
<thead>
<tr>
<th>Term</th>
<th>Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1 (\times) 1</td>
</tr>
<tr>
<td>3</td>
<td>1 (\times) 3</td>
</tr>
<tr>
<td>6</td>
<td>2 (\times) 3</td>
</tr>
<tr>
<td>10</td>
<td>2 (\times) 5</td>
</tr>
<tr>
<td>15</td>
<td>3 (\times) 5</td>
</tr>
</tbody>
</table>

At this stage, we may not yet have spotted a pattern. So we investigate the effect of multiplying the smaller of each pair of factors by 2, and obtain an interesting pattern.

<table>
<thead>
<tr>
<th>Term</th>
<th>Factors</th>
<th>Smaller (\times) 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1 (\times) 1</td>
<td>2 (\times) 1</td>
</tr>
<tr>
<td>3</td>
<td>1 (\times) 3</td>
<td>2 (\times) 3</td>
</tr>
<tr>
<td>6</td>
<td>2 (\times) 3</td>
<td>4 (\times) 3</td>
</tr>
<tr>
<td>10</td>
<td>2 (\times) 5</td>
<td>4 (\times) 5</td>
</tr>
<tr>
<td>15</td>
<td>3 (\times) 5</td>
<td>6 (\times) 5</td>
</tr>
</tbody>
</table>

That is:

\[1 \times 2 \quad 2 \times 3 \quad 3 \times 4 \quad 4 \times 5 \quad 5 \times 6\]

We can further break down this last set of numbers to obtain:

\[1 \times (1 + 1) \quad 2 \times (2 + 1) \quad 3 \times (3 + 1) \quad 4 \times (4 + 1) \quad 5 \times (5 + 1)\]

the pattern of which is given by \(n \times (n + 1)\).

This gives terms twice the size of those in the sequence 1, 3, 6, 10, 15, … so we need to change the expression to \(\frac{1}{2} \times n(n + 1)\).

So the \(n\)th term is \(\frac{1}{2}n(n + 1)\).
Expressions of the form $an^2 + bn + c$

These expressions are unlikely to appear in a GCSE exam but could easily appear in an AO1 coursework task. This method will give an algebraic means of showing a sequence.

**EXAMPLE 19**

Find the $n$th term of the sequence 5, 15, 31, 53, ....

Set up a difference table.

<table>
<thead>
<tr>
<th>$n$</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>$n$th term</td>
<td>5</td>
<td>15</td>
<td>31</td>
<td>53</td>
</tr>
<tr>
<td>1st difference</td>
<td>10</td>
<td>16</td>
<td>22</td>
<td></td>
</tr>
<tr>
<td>2nd difference</td>
<td>6</td>
<td>6</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Now extend the table backwards to get the term for $n = 0$ and call the three lines of the table $c$, $a + b$ and $2a$.

<table>
<thead>
<tr>
<th>$n$</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>$c$</td>
<td>1</td>
<td>5</td>
<td>15</td>
<td>31</td>
<td>53</td>
</tr>
<tr>
<td>$a + b$</td>
<td>4</td>
<td>10</td>
<td>16</td>
<td>22</td>
<td></td>
</tr>
<tr>
<td>$2a$</td>
<td>6</td>
<td>6</td>
<td>6</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This gives $2a = 6$ $\Rightarrow$ $a = 3$, $a + b = 4$ $\Rightarrow$ $b = 1$, $c = 1$

Giving the $n$th term as: $3n^2 + n + 1$

**EXAMPLE 20**

Find the $n$th term of the sequence 3, 5, 8, 12, 17, ....

Set up a difference table.

<table>
<thead>
<tr>
<th>$n$</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>$c$</td>
<td>2</td>
<td>3</td>
<td>5</td>
<td>8</td>
<td>12</td>
<td>17</td>
</tr>
<tr>
<td>$a + b$</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
<td></td>
</tr>
<tr>
<td>$2a$</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This gives $2a = 1$ $\Rightarrow$ $a = \frac{1}{2}$, $a + b = 1$ $\Rightarrow$ $b = \frac{1}{2}$, $c = 2$

Giving the $n$th term as: $\frac{1}{2}n^2 + \frac{1}{2}n + 2$
EXERCISE 20F

For each of the sequences a to e i write down the next two terms ii find the $n$th term.

- a $0, 3, 8, 15, 24, ...$
- b $3, 6, 11, 18, 27, ...$
- c $4, 7, 12, 19, 28, ...$
- d $-1, 2, 7, 14, 23, ...$
- e $11, 14, 19, 26, ...$

For each of the sequences a to e i write down the next two terms ii find the $n$th term.

- a $5, 10, 17, 26, ...$
- b $3, 8, 15, 24, ...$
- c $9, 14, 21, 30, ...$
- d $10, 17, 26, 37, ...$
- e $8, 15, 24, 35, ...$

Look at each of the following sequences to see whether the rule is linear, quadratic on $n^2$ alone or fully quadratic. Then

i write down the $n$th term ii write down the 50th term.

- a $5, 8, 13, 20, 29, ...$
- b $5, 8, 11, 14, 17, ...$
- c $3, 8, 15, 24, 35, ...$
- d $5, 12, 21, 32, 45, ...$
- e $3, 6, 11, 18, 27, ...$
- f $1, 6, 11, 16, 21, ...$

Find the $n$th terms of the following sequences in the form $an^2 + bn + c$.

- a $1, 4, 11, 22, 37, ...$
- b $2, 13, 30, 53, 82, ...$
- c $4, 8, 13, 19, 26, ...$

20.6 Changing the subject of a formula

In this section you will learn how to:
- change the subject of a formula where the subject occurs more than once

Key words
- subject
- transpose

You already have met changing the subject of a formula in which the subject appears only once (see page 104). This is like solving an equation but using letters. You have also solved equations in which the unknown appears on both sides of the equation. This requires the unknown (usually $x$) terms to be collected on one side and the numbers to be collected on the other.

We can do something similar, to transpose formulae in which the subject appears more than once. The principle is the same. Collect all the subject terms on the same side and everything else on the other side. Most often, we then need to factorise the subject out of the resulting expression.
Example 21

Make \( x \) the subject of this formula.

\[ ax + b = cx + d \]

First, rearrange the formula to get all the \( x \) terms on the left-hand side and all the other terms on the right-hand side. (The rule “change sides – change signs” still applies.)

\[ ax - cx = d - b \]

Factorise \( x \) out of left-hand side to get:

\[ x(a - c) = d - b \]

Divide by the bracket, which gives:

\[ x = \frac{d - b}{a - c} \]

Example 22

Make \( p \) the subject of this formula.

\[ 5 = \frac{ap + b}{cp + d} \]

First, multiply both sides by the denominator of the algebraic fraction, which gives:

\[ 5(cp + d) = ap + b \]

Expand the bracket to get:

\[ 5cp + 5d = ap + b \]

Now continue as in Example 21:

\[ 5cp - ap = b - 5d \]

\[ p(5c - a) = b - 5d \]

\[ p = \frac{b - 5d}{5c - a} \]

Exercise 20G

In questions 1 to 10, make the letter in brackets the subject of each formula.

1. \( 3(x + 2y) = 2(x - y) \) \( (x) \)
2. \( 3(x + 2y) = 2(x - y) \) \( (y) \)
3. \( 5 = \frac{a + b}{a - c} \) \( (a) \)
4. \( p(a + b) = q(a - b) \) \( (a) \)
5. \( p(a + b) = q(a - b) \) \( (b) \)
6. \( A = 2\pi h + \pi r k \) \( (r) \)
7. \( v^2 = u^2 + av^2 \) \( (v) \)
8. \( s(t - r) = 2(r - 3) \) \( (r) \)
9. \( s(t - r) = 2(r - 3) \) \( (r) \)
10. \( R = \frac{x - 3}{x - 2} \) \( (x) \)
a The perimeter of the shape shown on the right is given by the formula \( P = \pi r + 2kr \). Make \( r \) the subject of this formula.

b The area of the same shape is given by \( A = \frac{1}{2}(\pi r^2 + r^2\sqrt{k^2 - 1}) \). Make \( r \) the subject of this formula.

When \( \text{£}P \) is invested for \( Y \) years at a simple interest rate of \( \text{R} \), the following formula gives the amount, \( A \), at any time:

\[
A = P + \frac{P \text{RY}}{100}
\]

Make \( P \) the subject of this formula.

When two resistors with values \( a \) and \( b \) are connected in parallel, the total resistance is given by:

\[
R = \frac{ab}{a + b}
\]

a Make \( b \) the subject of the formula.

b Write the formula when \( a \) is the subject.

c Make \( x \) the subject of this formula.

\[
y = \frac{x + 2}{x - 2}
\]

b Show that the formula \( y = 1 + \frac{4}{x - 2} \) can be rearranged to give:

\[
x = 2 + \frac{4}{y - 1}
\]

c Combine the right-hand sides of each formula in part b into single fractions and simplify as much as possible.

d What do you notice?

The volume of the solid shown is given by:

\[
V = \frac{1}{2}\pi r^3 + \pi r^3h
\]

a Explain why it is not possible to make \( r \) the subject of this formula.

b Make \( \pi \) the subject.

c If \( h = r \), can the formula be rearranged to make \( r \) the subject? If so, rearrange it to make \( r \) the subject.

Make \( x \) the subject of this formula.

\[
W = \frac{1}{2}z(x + y) + \frac{1}{2}y(x + z)
\]
Here is a sequence of numbers.
29 25 21 17 13

i. Write down the next two numbers in the sequence.
ii. Write down the rule for continuing the sequence.

Another sequence of numbers begins:
2 5 14 41

The rule for continuing this sequence is:
Multiply by 3 and subtract 1.

i. What is the next number in the sequence?
ii. The same rule is used for a sequence that starts with the number 7. What is the second number in this sequence?

The first 10 prime numbers are 2, 3, 5, 7, 11, 13, 17, 19, 23, 29.
P is a prime number.
Q is an odd number.
State whether each of the following is always odd, always even or could be either odd or even.

<table>
<thead>
<tr>
<th>□□□</th>
<th>Always odd</th>
<th>□□□</th>
<th>Always even</th>
<th>□□□</th>
<th>Could be either odd or even</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>P(Q + 1)</td>
<td>b</td>
<td>Q − P</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The nth term of a sequence is 3n − 1.

a. Write down the first and second terms of the sequence.
b. Which term of the sequence is equal to 32?
c. Explain why 85 is not a term in this sequence.

d. The nth term of a sequence is 4n − 1.
i. Write down the first three terms of the sequence.
ii. Is 132 a term in this sequence? Explain your answer.

Tom builds fencing from pieces of wood as shown.

Diagram 1
five pieces of wood

Diagram 2
nine pieces of wood

Diagram 3
13 pieces of wood

How many pieces of wood will be in diagram n?

The first four terms of an arithmetic sequence are
21 17 13 9

Find, in terms of n, an expression for the nth term of this sequence.

Edexcel, Question 2, Paper 10B Higher, January 2005

Here is a sequence made from a pattern of dots.

1st pattern    2nd pattern    3rd pattern

a. Complete the table.

<table>
<thead>
<tr>
<th>Pattern</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of dots</td>
<td>5</td>
<td>8</td>
<td>11</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

b. How many dots are in the 7th pattern?
c. How many dots are in the nth pattern?
d. Which pattern has 62 dots in it?

A witch's hat shape is made from a rectangular piece of card by cutting out two identical quadrants of a circle, radius r cm.

a. Show that the shaded area is given by the formula

\[ A = 2r^2 - \frac{1}{2}\pi r^2 \]

b. Find the area of the rectangle if the area of the witch hat is 16 cm².

\[ \frac{3}{4x + 1} - \frac{4}{x + 2} = 2 \]

Simplify to

\[ 8x^2 + 31x + 2 = 0 \]

Hence, or otherwise, solve the following equation

\[ \frac{3}{4x + 1} - \frac{4}{x + 2} = 2 \]
giving your answer to 2 decimal places.

Solve the equation

\[ \frac{2x + 3}{5} = \frac{3x - 4}{8} = 1 \]

Make x the subject of this formula.

\[ p(q - x) = px + q^2 \]

Make x the subject of this formula.

\[ y = \frac{2x + 3}{x - 5} \]

Solve the simultaneous equations

\[ \begin{align*}
xy &= 32 \\
4y - 3x &= 26
\end{align*} \]

A straight line has the equation \( y = 2x + 1 \)

A curve has the equation \( y^2 = 8x \)

Find the point of intersection of the line and the curve.

Simplify fully

\[ \frac{3x^2 - 5x - 2}{x^2 + x - 6} \]

WORKED EXAM QUESTION

Make \( g \) the subject of the following formula.

\[ \frac{t(3 + g)}{B - g} = 2 \]

\[ t(3 + g) = 2(B - g) \]

Cross multiply to get rid of the fraction

\[ 3t + gt = 16 - 2g \]

Expand the brackets

\[ gt + 2g = 16 - 3t \]

Collect all the \( g \) terms on the left-hand side and other terms on the right-hand side.

\[ g(t + 2) = 16 - 3t \]

Simplify, \( gt + 2g = g(t + 2) \), and divide by \( t + 2 \).

\[ g = \frac{16 - 3t}{t + 2} \]
A group of friends plan an eight-day walking holiday. The profile of their first four daily walks is shown below.

For every day they work out the horizontal distance they walk in kilometres, and the height they climb in metres.

They calculate the time each day’s walk will take using the formula

\[ T = 15D + \frac{H}{10} \]

where: \( T \) = time in minutes \( D \) = distance in km \( H \) = height climbed in m

This formula assumes an average walking speed of 4km/h and an extra minute for each 10 metres climbed.

Copy this table and help them complete it. Work out the time each day’s walk will take, and the time that the group expects to finish.

GRADE YOURSELF

- Able to substitute numbers into an \( n \)th term rule
- Able to understand how odd and even numbers interact in addition, subtraction and multiplication problems
- Able to give the \( n \)th term of a linear sequence
- Able to give the \( n \)th term of a sequence of powers of 2 or 10
- Able to find the \( n \)th term of a quadratic sequence
- Able to solve linear equations involving algebraic fractions where the subject appears as the numerator
- Able to rearrange a formula where the subject appears twice
- Able to combine algebraic fractions using the four rules of addition, subtraction, multiplication and division
- Able to rearrange more complicated formulae where the subject may appear twice or as a power
- Able to solve a quadratic equation obtained from algebraic fractions where the variable appears in the denominator
- Able to simplify algebraic fractions by factorisation and cancellation
- Able to solve a pair of simultaneous equations where one is linear and the other is non-linear

What you should know now

- Be able to manipulate algebraic fractions and solve equations resulting from the simplified fractions
- Be able to solve a pair of simultaneous equations where one is linear and one is non-linear
- Be able to recognise a linear sequence and find its \( n \)th term
- Be able to recognise a sequence of powers of 2 or 10
- Be able to recognise a non-linear sequence and find its \( n \)th term
- Be able to rearrange a formula where the subject appears twice
This chapter will show you ...

● how to decide whether a formula represents a length, an area or a volume

● how to check that a formula has consistent dimensions

What you should already know

● The formulae for perimeters, areas and volumes of common shapes

● The common units used for length, area and volume

Quick check ➔ ANSWERS

Write down a formula for each of the following.

1 The perimeter of a square with side length \( l \).
2 The circumference of a circle with diameter \( d \).
3 The area of a triangle with base \( h \) and height \( h \).
4 The area of a circle with radius \( r \).
5 The volume of a cube with side length \( l \).
6 The volume of a cylinder with radius \( r \) and height \( h \).
When we have an unknown length or distance in a problem, we represent it by a single letter, followed by the unit in which it is measured. For example,

\( t \) centimetres \( x \) miles \( y \) kilometres

In the example, each letter is a length and has the dimension or measure of length, i.e. centimetre, metre, kilometre, etc. The numbers or coefficients written before the letters are not lengths and therefore have no dimensions. So, for example, 2\( x \), 5\( y \) or 1\( \frac{1}{2} p \) have the same dimension as \( x \), \( y \) or \( p \) respectively.

When just lengths are involved in a formula, the formula is said to have one dimension or 1-D, which is sometimes represented by the symbol \([L]\).
Find a formula for the perimeter of each of these shapes. Each letter represents a length.

1. $a + b$
2. $2x + y + z$
3. $x + y + 2z$
4. $a + b + c + d$
5. $2x + 2y$
6. $a + a + b$
7. $a + a + b$
8. $r + r$
9. $h$
10. $d + l$
Dimensions of area

In this section you will learn how to:

- find formulae for the area of 2-D shapes

Key words

2-D
area

EXAMPLE 2

Look at these four examples of formulae for calculating area.

\[ A = lb \] gives the area of a rectangle
\[ A = x^2 \] gives the area of a square
\[ A = 2ab + 2ac + 2bc \] gives the surface area of a cuboid
\[ A = \pi r^2 \] gives the area of a circle

These formulae have one thing in common. They all consist of terms that are the product of two lengths. You can recognise this by counting the number of letters in each term of the formula. The first formula has two (\(l\) and \(b\)). The second has two (\(x\) and \(x\)). The third has three terms, each of two letters (\(a\) and \(b\), \(a\) and \(c\), \(b\) and \(c\)). The fourth also has only two letters (\(r\) and \(r\)) because \(\pi\) is a number (3.14159...) which has no dimension.

We can recognise formulae for area because they only have terms that consist of two letters – that is, two lengths multiplied together. Numbers are not defined as lengths, since they have no dimensions. These formulae therefore have two dimensions or 2-D, which is sometimes represented by the symbol \([L^2]\).

This confirms the units in which area is usually measured. For example,

- square metres (\(m \times m\) or \(m^2\))
- square centimetres (\(cm \times cm\) or \(cm^2\))

EXERCISE 21B

Find a formula for the area of each of these shapes. Each letter represents a length.
We can recognise formulae for volume because they only have terms that consist of three letters – that is, three lengths multiplied together. They therefore have three dimensions or 3-D, which is sometimes represented by the symbol \([L^3]\). Once more, numbers are not defined as lengths, since they have no dimensions.

This confirms the units in which volume is usually measured. For example,

- cubic metres (\(m \times m \times m\) or \(m^3\))
- cubic centimetres (\(cm \times cm \times cm\) or \(cm^3\))

In this section you will learn how to:

- find formulae for the volume of 3-D shapes

**Key words**

- 3-D
- volume
Find a formula for the volume of each of these shapes. Each letter represents a length.

**In this section you will learn how to:**
- check that the dimensions of a formula are consistent

**Key words**
- consistency
- dimension
- formula

One way in which scientists and mathematicians check complicated formulae to see whether they are correct is to test for **consistency**. They check that every term in the formula is of the same **dimension**.

Each term in a formula must have the correct number of dimensions. It is not possible to have a formula with a mixture of terms, some of which have, for example, one dimension and some two dimensions. When terms are found to be mixed, the formula is said to be **inconsistent** and is not possible.

We are only concerned with lengths, areas and volumes, so it is easy for us to test for consistency.
EXAMPLE 4

Which of these expressions are consistent? If any are consistent, do they represent a length, an area or a volume?

\[ a \ a + bc \quad b \ \pi r^2 + ab \quad c \ r^5 + 2\pi r^2 \quad d \ \frac{(ab^2 + a^2 b)}{2} \quad e \ \frac{\pi (R^2 + r^2)}{x} \]

- \( a \) is inconsistent because the first term has one letter (1-D), and the second has two letters (2-D). Hence, it is a mixture of length and area. So it has no physical meaning, i.e. \([L] + [L^2]\) is not possible.

- \( b \) is consistent because the first term has two letters \((r \text{ and } r)\) multiplied by a dimensionless number \((\pi)\), and the second term also has two letters \((a \text{ and } b)\). Hence the expression could represent an area, i.e. \([L^2] + [L^2] = [L^2]\) is consistent.

- \( c \) is inconsistent because the first term is 3-D and the second term is 2-D. It is a mixture of volume and area, so it has no physical meaning, i.e. \([L^3] + [L^2]\) is not possible.

- \( d \) is consistent. Each term is 3-D and hence the expression could represent a volume, i.e. \([L^3] + [L^3] = [L^3]\) is consistent.

- \( e \) is consistent. There are two terms which are 2-D in the numerator and the term in the denominator is 1-D. The numerator can be cancelled to give two terms which are both 1-D. Hence the expression could represent a length, i.e. \([L^2]/[L] = [L]\) is consistent.

EXERCISE 21D

Each of these expressions represents a length, an area or a volume. Indicate which it is by writing L, A or V. Each letter represents a length.

\[
\begin{align*}
& a \ x^2 & b \ 2y & c \ \pi a & d \ \pi ab \\
& e \ xyz & f \ 3x^3 & g \ x^2 y & h \ 2xy \\
& i \ 4y & j \ 3ab^2 & k \ 4xz & l \ 5z \\
& m \ abc & n \ ab + bc & o \ abc + d & p \ 2ab + 3bc \\
& q \ a^2 b + ab^2 & r \ a^2 + b^2 & s \ \pi a^2 & t \ abc \\
& u \ \frac{(ab + bc)}{d} & v \ \frac{ab}{2} & w \ (a + b)^2 & x \ 4a^2 + 2ab \\
& y \ 3abc + 2abd + 4bcd + 2acd & z \ 4\pi r^3 + \pi r^2 h
\end{align*}
\]

Indicate whether each of these expressions is consistent (C) or inconsistent (I). Each letter represents a length.

\[
\begin{align*}
& a \ a + b & b \ a^2 + b & c \ a^2 + b^2 & d \ ab + c \\
& e \ ab + c^2 & f \ a^3 + bc & g \ a^3 + abc & h \ a^2 + abc \\
& i \ 3a^2 + bc & j \ 4a^2 b + 2ab^2 & k \ 3abc + 2a^2 y & l \ 3a(ab + bc) \\
& m \ 4a^2 + 3ab & n \ \pi a^2 (a + b) & o \ \pi a^2 + 2r^2 & p \ \pi r^3 h + \pi rh
\end{align*}
\]

Write down whether each of these expressions is consistent (C) or inconsistent (I). When it is consistent, say whether it represents a length (L), an area (A) or a volume (V). Each letter represents a length.

| q | \(\pi r^2(R + r)\) |
| r | \(\frac{(ab + bc)}{d}\) |
| s | \(a(b^2 + c)\) |
| t | \(\pi ab + \pi bc\) |
| u | \((a + b)(c + d)\) |
| v | \(\pi(a + b)(a^2 + b^2)\) |
| w | \(\pi(a^2 + b^2)\) |
| x | \(\pi^3(a + b)\) |
| y | \(\pi r^3h + \pi r^3\) |

What power * would make each expression consistent?

| a | \(\pi abc + a^*b\) |
| b | \(\frac{\pi r^3h}{2} + \pi h^* + \frac{r h^3}{2}\) |
| c | \(\pi a(b^* + ac)\) |
| d | \(a*b + ab^* + c^3\) |

Kerry has worked out a volume formula as

\[V = \frac{(2hD^2 + hd)}{4}\]

It is wrong. Why?

The diagram shows a cuboid with sides \(a, b\) and \(c\), with a circular hole radius \(r\) drilled through it. Three of the following formulae represent

A: the total length of all straight edges

B: the total surface area of the six flat sides

C: the volume.

Match the correct formula to each of the quantities A, B and C.

F₁: \(4\pi r\)

F₂: \(4(a + b + c)\)

F₃: \(abc - \pi^2a\)

F₄: \(2(a + b + c) + 2(bc - \pi^2)\)

Say what quantity the fourth formula represents.
In this question, the letters $a$, $b$ and $c$ represent lengths. State whether each expression could represent a length, an area or a volume.

- $2abc$
- $3a + 2b + c$
- $\pi(a^2 - b^2)$

In this question, the letters $x$, $y$ and $z$ represent lengths. State whether each expression could represent a length, an area or a volume.

- $xy + yz$
- $\pi xyz$
- $3(x + y + z)$

This table shows some expressions. The letters $x$, $y$ and $z$ represent lengths. Copy the table below. Place a tick in the appropriate column for each expression to show whether the expression can be used to represent a length, an area or none of these.

<table>
<thead>

</tbody>
</table>

Two of the expressions could represent areas. Copy the table and tick the boxes (✓) underneath these two expressions.

Edexcel, Question 11, Paper 17 Intermediate, June 2003

The diagram shows an ellipse of width $2a$ cm and height $2b$ cm. Which of the following is a formula for the area of the ellipse?

- $\pi(2a + 2b)$
- $\pi a b$
- $4a^2b^2$

Here are some expressions. The letters $a$, $b$ and $c$ represent lengths. $\pi$, 2 and $\frac{1}{2}$ are numbers which have no dimension. Three of the expressions could represent areas. Copy the table and tick (✓) the boxes underneath the three expressions which could represent areas.

<table>
<thead>
<tr>

</tbody>
</table>

Three of the expressions could represent areas. Copy the table and tick (✓) the boxes underneath the three expressions which could represent areas.

Edexcel, Question 2, Paper 10B Higher, January 2005

**WORKED EXAM QUESTION**

$r$, $a$ and $b$ are all lengths. Which of the following expressions could be a volume? Write Yes or No for each one. If the expression could not be a volume, give a reason.

- $\frac{ar}{2}(4b + 6r)$
- $2a^2 + 16b^2$
- $4a^3 + rb^3$
- $2abr + \frac{\pi a b^2}{2}$

**Solution**

1. Yes, $[L^2] \times [L + L] = [L^2] \times [L] = [L^3]$
2. No, $[L^2] + [L^2]$ is an area
3. No, $[L^2] + [L^2]$ inconsistent
4. Yes, $[L^2] + [L^2] = [L^2]$
GRADE YOURSELF

- Able to work out a formula for the perimeter, area or volume of simple shapes
- Able to work out a formula for the perimeter, area or volume of complex shapes
- Able to work out whether an expression or formula is dimensionally consistent and whether it represents a length, an area or a volume

What you should know now

- How to work out a formula for the length, area or volume of a shape
- How to recognise whether a formula is 1-D, 2-D or 3-D
- How to recognise when a formula or expression is consistent
This chapter will show you ...

● how to solve problems where two variables are connected by a relationship that varies in direct or inverse proportion

What you should already know

● Squares, square roots, cubes and cube roots of integers
● How to substitute values into algebraic expressions
● How to solve simple algebraic equations

Quick check

1 Write down the value of each of the following.
   \[ a \quad 5^2 \quad b \quad \sqrt{81} \quad c \quad 3^3 \quad d \quad 3\sqrt{64} \]

2 Calculate the value of \( y \) if \( x = 4 \).
   \[ a \quad y = 3x^2 \quad b \quad y = \frac{1}{\sqrt{x}} \]
The term *direct variation* has the same meaning as *direct proportion*.

There is direct variation (or direct proportion) between two variables when one variable is a simple multiple of the other. That is, their ratio is a constant.

For example:

- 1 kilogram = 2.2 pounds There is a multiplying factor of 2.2 between kilograms and pounds.
- Area of a circle = $\pi r^2$ There is a multiplying factor of $\pi$ between the area of a circle and the square of its radius.

An examination question involving direct variation usually requires you first to find this multiplying factor (called the *constant of proportionality*), then to use it to solve a problem.

The symbol for variation or proportion is $\propto$.

So the statement “Pay is directly proportional to time” can be mathematically written as

\[ \text{Pay} \propto \text{Time} \]

which implies that

\[ \text{Pay} = k \times \text{Time} \]

where $k$ is the constant of proportionality.

There are three steps to be followed when solving a question involving proportionality.

**Step 1:** set up the proportionality equation (you may have to define variables).

**Step 2:** use the given information to find the constant of proportionality.

**Step 3:** substitute the constant of proportionality in the original equation and use this to find unknown values.
EXAMPLE 1

The cost of an article is directly proportional to the time spent making it. An article taking 6 hours to make costs £30. Find the following.

a the cost of an article that takes 5 hours to make
b the length of time it takes to make an article costing £40

Step 1: Let $C$ be the cost of making an article and $t$ the time it takes. We then have:

$$C \propto t$$

$$\Rightarrow C = kt$$

where $k$ is the constant of proportionality.

Note that we can “replace” the proportionality sign $\propto$ with $= k$ to obtain the proportionality equation.

Step 2: Since $C = £30$ when $t = 6$ hours, then $30 = 6k$

$$\Rightarrow \frac{30}{6} = k$$

$$\Rightarrow k = 5$$

Step 3: So the formula is $C = 5t$

a When $t = 5$ hours $C = 5 \times 5 = 25$

So the cost is £25.

b When $C = £40$ $40 = 5 \times t$

$$\Rightarrow \frac{40}{5} = t \Rightarrow t = 8$$

So the making time is 8 hours.

EXERCISE 22A ➔ ANSWERS

In each case, first find $k$, the constant of proportionality, and then the formula connecting the variables.

1. $T$ is directly proportional to $M$. If $T = 20$ when $M = 4$, find the following.
   a $T$ when $M = 3$
   b $M$ when $T = 10$

2. $W$ is directly proportional to $F$. If $W = 45$ when $F = 3$, find the following.
   a $W$ when $F = 5$
   b $F$ when $W = 90$

3. $Q$ varies directly with $P$. If $Q = 100$ when $P = 2$, find the following.
   a $Q$ when $P = 3$
   b $P$ when $Q = 300$

4. $X$ varies directly with $Y$. If $X = 17.5$ when $Y = 7$, find the following.
   a $X$ when $Y = 9$
   b $Y$ when $X = 30$
The distance covered by a train is directly proportional to the time taken. The train travels 105 miles in 3 hours.

a What distance will the train cover in 5 hours?

b What time will it take for the train to cover 280 miles?

The cost of fuel delivered to your door is directly proportional to the weight received. When 250 kg is delivered, it costs £47.50.

a How much will it cost to have 350 kg delivered?

b How much would be delivered if the cost were £33.25?

The number of children who can play safely in a playground is directly proportional to the area of the playground. A playground with an area of 210 m² is safe for 60 children.

a How many children can safely play in a playground of area 154 m²?

b A playgroup has 24 children. What is the smallest playground area in which they could safely play?

Direct proportions involving squares, cubes and square roots

The process is the same as for a linear direct variation, as the next example shows.

**EXAMPLE 2**

The cost of a circular badge is directly proportional to the square of its radius. The cost of a badge with a radius of 2 cm is 68p.

a Find the cost of a badge of radius 2.4 cm.

b Find the radius of a badge costing £1.53.

**Step 1:** Let \( C \) be the cost and \( r \) the radius of a badge. Then

\[ C \propto r^2 \]

\[ C = kr^2 \] where \( k \) is the constant of proportionality.

**Step 2:** \( C = 68p \) when \( r = 2 \) cm. So

\[ 68 = 4k \]

\[ \frac{68}{4} = k \Rightarrow k = 17 \]

Hence the formula is \( C = 17r^2 \)

a When \( r = 2.4 \) cm

\[ C = 17 \times 2.4^2p = 97.92p \]

Rounding off gives the cost as 98p.

b When \( C = 153p \)

\[ \frac{153}{17} = 9 \Rightarrow r^2 \]

\[ r = \sqrt{9} = 3 \]

Hence, the radius is 3 cm.
In each case, first find \( k \), the constant of proportionality, and then the formula connecting the variables.

1. \( T \) is directly proportional to \( x^2 \). If \( T = 36 \) when \( x = 3 \), find the following.
   - \( T \) when \( x = 5 \)
   - \( x \) when \( T = 400 \)

2. \( W \) is directly proportional to \( M^2 \). If \( W = 12 \) when \( M = 2 \), find the following.
   - \( W \) when \( M = 3 \)
   - \( M \) when \( W = 75 \)

3. \( E \) varies directly with \( \sqrt{C} \). If \( E = 40 \) when \( C = 25 \), find the following.
   - \( E \) when \( C = 49 \)
   - \( C \) when \( E = 10.4 \)

4. \( X \) is directly proportional to \( \sqrt{Y} \). If \( X = 128 \) when \( Y = 16 \), find the following.
   - \( X \) when \( Y = 36 \)
   - \( Y \) when \( X = 48 \)

5. \( P \) is directly proportional to \( f^3 \). If \( P = 400 \) when \( f = 10 \), find the following.
   - \( P \) when \( f = 4 \)
   - \( f \) when \( P = 50 \)

6. The cost of serving tea and biscuits varies directly with the square root of the number of people at the buffet. It costs £25 to serve tea and biscuits to 100 people.
   - How much will it cost to serve tea and biscuits to 400 people?
   - For a cost of £37.50, how many could be served tea and biscuits?

7. In an experiment, the temperature, in °C, varied directly with the square of the pressure, in atmospheres. The temperature was 20 °C when the pressure was 5 atm.
   - What will the temperature be at 2 atm?
   - What will the pressure be at 80 °C?

8. The weight, in grams, of ball bearings varies directly with the cube of the radius measured in millimetres. A ball bearing of radius 4 mm has a weight of 115.2 g.
   - What will a ball bearing of radius 6 mm weigh?
   - A ball bearing has a weight of 48.6 g. What is its radius?

9. The energy, in J, of a particle varies directly with the square of its speed in m/s. A particle moving at 20 m/s has 50 J of energy.
   - How much energy has a particle moving at 4 m/s?
   - At what speed is a particle moving if it has 200 J of energy?

10. The cost, in £, of a trip varies directly with the square root of the number of miles travelled. The cost of a 100-mile trip is £35.
    - What is the cost of a 500-mile trip (to the nearest £1)?
    - What is the distance of a trip costing £70?
There is inverse variation between two variables when one variable is directly proportional to the reciprocal of the other. That is, the product of the two variables is constant. So, as one variable increases, the other decreases.

For example, the faster you travel over a given distance, the less time it takes. So there is an inverse variation between speed and time. We say speed is inversely proportional to time.

\[ S \propto \frac{1}{T} \quad \text{and so} \quad S = \frac{k}{T} \]

which can be written as \( ST = k \).

**EXAMPLE 3**

\( M \) is inversely proportional to \( R \). If \( M = 9 \) when \( R = 4 \), find the following.

**a** \( M \) when \( R = 2 \)

**b** \( R \) when \( M = 3 \)

**Step 1:** \( M \propto \frac{1}{R} \Rightarrow M = \frac{k}{R} \) where \( k \) is the constant of proportionality.

**Step 2:** When \( M = 9 \) and \( R = 4 \), we get \( 9 = \frac{k}{4} \)

\[ 9 \times 4 = k \Rightarrow k = 36 \]

**Step 3:** So the formula is \( M = \frac{36}{R} \)

**a** When \( R = 2 \), then \( M = \frac{36}{2} = 18 \)

**b** When \( M = 3 \), then \( 3 = \frac{36}{R} \Rightarrow 3R = 36 \Rightarrow R = 12 \)

**EXERCISE 22C**

In each case, first find the formula connecting the variables.

1. \( T \) is inversely proportional to \( m \). If \( T = 6 \) when \( m = 2 \), find the following.
   \( a \) \( T \) when \( m = 4 \) \( b \) \( m \) when \( T = 4.8 \)

2. \( W \) is inversely proportional to \( x \). If \( W = 5 \) when \( x = 12 \), find the following.
   \( a \) \( W \) when \( x = 3 \) \( b \) \( x \) when \( W = 10 \)
Q varies inversely with \((5 - t)\). If \(Q = 8\) when \(t = 3\), find the following.

\[
\begin{align*}
\text{a } & \text{ Q when } t = 10 \\
\text{b } & \text{ t when } Q = 16
\end{align*}
\]

M varies inversely with \(t^2\). If \(M = 9\) when \(t = 2\), find the following.

\[
\begin{align*}
\text{a } & \text{ M when } t = 3 \\
\text{b } & \text{ t when } M = 1.44
\end{align*}
\]

W is inversely proportional to \(\sqrt{T}\). If \(W = 6\) when \(T = 16\), find the following.

\[
\begin{align*}
\text{a } & \text{ W when } T = 25 \\
\text{b } & \text{ T when } W = 2.4
\end{align*}
\]

The grant available to a section of society was inversely proportional to the number of people needing the grant. When 30 people needed a grant, they received £60 each.

\[
\begin{align*}
\text{a } & \text{ What would the grant have been if 120 people had needed one?} \\
\text{b } & \text{ If the grant had been £50 each, how many people would have received it?}
\end{align*}
\]

While doing underwater tests in one part of an ocean, a team of scientists noticed that the temperature in °C was inversely proportional to the depth in kilometres. When the temperature was 6 °C, the scientists were at a depth of 4 km.

\[
\begin{align*}
\text{a } & \text{ What would the temperature have been at a depth of 8 km?} \\
\text{b } & \text{ To what depth would they have had to go to find the temperature at 2 °C?}
\end{align*}
\]

A new engine was being tested, but it had serious problems. The distance it went, in km, without breaking down was inversely proportional to the square of its speed in m/s. When the speed was 12 m/s, the engine lasted 3 km.

\[
\begin{align*}
\text{a } & \text{ Find the distance covered before a breakdown, when the speed is 15 m/s.} \\
\text{b } & \text{ On one test, the engine broke down after 6.75 km. What was the speed?}
\end{align*}
\]

In a balloon it was noticed that the pressure, in atmospheres, was inversely proportional to the square root of the height, in metres. When the balloon was at a height of 25 m, the pressure was 1.44 atm.

\[
\begin{align*}
\text{a } & \text{ What was the pressure at a height of 9 m?} \\
\text{b } & \text{ What would the height have been if the pressure was 0.72 atm?}
\end{align*}
\]

The amount of waste which a firm produces, measured in tonnes per hour, is inversely proportional to the square root of the size of the filter beds, measured in m². At the moment, the firm produces 1.25 tonnes per hour of waste, with filter beds of size 0.16 m².

\[
\begin{align*}
\text{a } & \text{ The filter beds used to be only 0.01 m². How much waste did the firm produce then?} \\
\text{b } & \text{ How much waste could be produced if the filter beds were 0.75 m²?}
\end{align*}
\]
EXAM QUESTIONS

1. y is proportional to $\sqrt[3]{x}$. Complete the table.

<table>
<thead>
<tr>
<th>x</th>
<th>25</th>
<th>10</th>
<th>20</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td></td>
<td></td>
<td></td>

2. The energy, $E$, of an object moving horizontally is directly proportional to the speed, $v$, of the object.
When the speed is 10 m/s the energy is 40 000 Joules.

a. Find an equation connecting $E$ and $v$.
b. Find the speed of the object when the energy is 14 400 Joules.

c. y is inversely proportional to the cube root of $x$.
When $y = 8$, $x = \frac{1}{2}$.

a. Find an expression for $y$ in terms of $x$.
b. Calculate
   i. the value of $y$ when $x = \frac{1}{125}$.
   ii. the value of $x$ when $y = 2$.

d. $d$ is directly proportional to the square of $t$.

a. Express $d$ in terms of $t$.
b. Work out the value of $d$ when $t = 7$.
c. Work out the positive value of $t$ when $d = 45$.

Edexcel, Question 16, Paper 5 Higher, June 2005

7. The force, $F$, between two magnets is inversely proportional to the square of the distance, $x$, between them.
When $x = 3$, $F = 4$.

a. Find an expression for $F$ in terms of $x$.
b. Calculate $F$ when $x = 2$.
c. Calculate $x$ when $F = 64$.

Edexcel, Question 17, Paper 5 Higher, June 2003

8. Two variables, $x$ and $y$, are known to be proportional to each other. When $x = 10$, $y = 25$.
Find the constant of proportionality, $k$, if:
   a. $y = x$
   b. $y = \frac{x^2}{2}$
   c. $y = \frac{1}{x}$
   d. $\sqrt[3]{y} = \frac{1}{x}$

9. $x$ is directly proportional to the cube root of $x$.
When $x = 27$, $y = 6$.

a. Find the value of $y$ when $x = 125$.
b. Find the value of $x$ when $y = 3$.

10. The surface area, $A$, of a solid is directly proportional to the square of the depth, $d$. When $d = 6$, $A = 12\pi$.

a. Find the value of $A$ when $d = 12$.
   Give your answer in terms of $\pi$.
b. Find the value of $d$ when $A = 27\pi$.

11. $r$ is inversely proportional to $t$.

   $r = 12$ when $t = 0.2$
   Calculate the value of $r$ when $t = 4$.

Edexcel, Question 4, Paper 13B Higher, January 2003

12. The frequency, $f$, of sound is inversely proportional to the wavelength, $\lambda$. A sound with a frequency of 36 hertz has a wavelength of 20.25 metres.
Calculate the frequency when the frequency and the wavelength have the same numerical value.

13. $t$ is proportional to $m^3$.

   a. When $m = 6$, $t = 324$.
   Find the value of $t$ when $m = 10$.
   Also, $m$ is inversely proportional to the square root of $w$.
b. When $r = 12$, $w = 25$.
   Find the value of $w$ when $m = 4$.

14. $P$ and $Q$ are positive quantities. $P$ is inversely proportional to $Q^2$.
When $P = 160$, $Q = 20$.
Find the value of $P$ when $P = Q$.
WORKED EXAM QUESTION

y is inversely proportional to the square of x. When y is 40, x = 5.

a Find an equation connecting x and y.
b Find the value of y when x = 10.

Solution

a \( y \propto \frac{1}{x^2} \)

\[ y = \frac{k}{x^2} \]

40 = \( \frac{k}{25} \)

\[ k = 40 \times 25 = 1000 \]

\[ y = \frac{1000}{x^2} \]

or \( xy^2 = 1000 \)

b When x = 10, \( y = \frac{1000}{10^2} = \frac{1000}{100} = 10 \)

The mass of a solid, \( M \), is directly proportional to the cube of its height, \( h \). When \( h = 10, M = 4000 \).

The surface area, \( A \), of the solid is directly proportional to the square of the height, \( h \). When \( h = 10, A = 50 \).

Find A, when \( M = 32\,000 \).

Solution

\[ M = kh^3 \]

4000 = \( k \times 1000 \) \[ \Rightarrow k = 4 \]

So, \( M = 4h^3 \)

\[ A = ph^2 \]

50 = \( p \times 100 \) \[ \Rightarrow p = \frac{1}{2} \]

So, \( A = \frac{1}{2}h^2 \)

32000 = 4\( h^3 \)

\[ h^3 = 8000 \] \[ \Rightarrow h = 20 \]

\[ A = \frac{1}{2}(20)^2 = \frac{400}{2} = 200 \]
An electricity company wants to build some offshore wind turbines (as shown below). The company is concerned about how big the turbines will look to a person standing on the shore. It asks an engineer to calculate the angle of elevation from the shore to the highest point of a turbine, when it is rotating, if the turbine was placed at different distances out to sea. Help the engineer to complete the first table below.

The power available in the wind is measured in watts per metre squared of rotor area (W/m²). Wind speed is measured in metres per second (m/s). The power available in the wind is proportional to the cube of its speed. A wind speed of 7 m/s can provide 210 W/m² of energy. Complete the table below to show the available power at different wind speeds.

Remember

1 W = 1 watt
1000 W = 1 kW = 1 kilowatt
1000 kW = 1 MW = 1 megawatt
GRADE YOURSELF

A Able to find formulae describing direct or inverse variation and use them to solve problems

A Able to solve direct and inverse variation problems involving three variables

What you should know now

- How to recognise direct and inverse variation
- What a constant of proportionality is, and how to find it
- How to find formulae describing inverse or direct variation
- How to solve problems involving direct or inverse variation
This chapter will show you ...

- how to find the limits of numbers rounded to certain accuracies
- how to use limits of accuracy in calculations

Quick check

1 Round off 6374 to
   a the nearest 10,
   b the nearest 100,
   c the nearest 1000.

2 Round off 2.389 to
   a one decimal place,
   b two decimal places.

3 Round off 47.28 to
   a one significant figure,
   b three significant figures.
Any recorded measurement will have been rounded off to some degree of accuracy. This defines the possible true value before rounding off took place, and hence the limits of accuracy. The range of values between the limits of accuracy is called the rounding error.

**EXAMPLE 1**
A stick of wood is measured as 32 cm to the nearest centimetre.
Between what limits does the actual length of the stick lie?
The lower limit is 31.5 cm as a halfway value is always rounded up.
The upper limit is 32.499999999... cm. In other words it can get as close to 32.5 cm as possible but not be 32.5 cm. However 32.5 cm is the upper limit. So we say 31.5 cm ≤ length of stick < 32.5 cm.
Note the use of the strict inequality for the upper limit.

**EXAMPLE 2**
53.7 is accurate to one decimal place. What are the limits of accuracy?
The smallest possible value is 53.65.
The largest possible value is 53.749999999... but once again we say 53.75 is the upper limit.
Hence the limits of accuracy are 53.65 ≤ 53.7 < 53.75

**EXAMPLE 3**
A skip has a mass of 220 kg measured to three significant figures. What are the limits of accuracy of the mass of the skip?
The smallest possible value is 219.5 kg.
The largest possible value is 220.499999999... kg but once again we say 220.5 kg is the upper limit.
Hence the limits of accuracy are 219.5 kg ≤ mass of skip < 220.5 kg

Note that the limits of accuracy are always given to one more degree of accuracy than the rounded value. For example 32 is the nearest integer and the limits are to half a unit; 53.7 is to 1 decimal place and the limits are to 2 decimal places; 220 is to 3 significant figures and the limits are to 4 significant figures.
Be careful as questions sometimes ask about the limits of discrete data.

**EXERCISE 23A → ANSWERS**

Write down the limits of accuracy of the following.

- a 7 cm measured to the nearest centimetre
- b 120 grams measured to the nearest 10 grams
- c 3400 kilometres measured to the nearest 100 kilometres
- d 50 mph measured to the nearest mph
- e £6 given to the nearest £
- f 16.8 cm to the nearest tenth of a centimetre
- g 16 kg to the nearest kilogram
- h a football crowd of 14 500 given to the nearest 100
- i 55 miles given to the nearest mile
- j 55 miles given to the nearest 5 miles

Write down the limits of accuracy for each of the following values which are rounded to the given degree of accuracy.

- a 6 cm (1 significant figure)
- b 17 kg (2 significant figures)
- c 32 min (2 significant figures)
- d 238 km (3 significant figures)
- e 7.3 m (1 decimal place)
- f 25.8 kg (1 decimal place)
- g 3.4 h (1 decimal place)
- h 87 g (2 significant figures)
- i 4.23 mm (2 decimal places)
- j 2.19 kg (2 decimal places)
- k 12.67 min (2 decimal places)
- l 25 m (2 significant figures)
- m 40 cm (1 significant figure)
- n 600 g (2 significant figures)
- o 30 min (1 significant figure)
- p 1000 m (2 significant figures)
- q 4.0 m (1 decimal place)
- r 7.04 kg (2 decimal places)
- s 12.0 s (1 decimal place)
- t 7.00 m (2 decimal places)

---

CHAPTER 23: NUMBER AND LIMITS OF ACCURACY

**EXAMPLE 4**

A coach carrying 50 people measured to the nearest 10, is travelling at 50 mph measured to the nearest 10 mph. What are the actual limits of the number of people and the speed?

This is an example of the difference between **discrete** and **continuous data**. The number of people is **discrete data** as it can only take integer values, but speed is **continuous data** as it can take any value in a range.

The limits are $45 \leq \text{number of people} \leq 54$, $45 \text{ mph} \leq \text{speed} < 55 \text{ mph}$. 

Upper and lower bounds

A journey of 26 miles measured to the nearest mile could actually be as long as 26.4999999… miles or as short as 25.5 miles. It could not be 26.5 miles, as this would round up to 27 miles. However, 26.4999999… is virtually the same as 26.5.

We overcome this difficulty by saying that 26.5 is the upper bound of the measured value and 25.5 is its lower bound. We can therefore write

\[ 25.5 \text{ miles} \leq \text{actual distance} < 26.5 \text{ miles} \]

which states that the actual distance is greater than or equal to 25.5 miles but less than 26.5 miles.

Although it is not wrong to give the upper bound as 26.49999… it is mathematically neater to give 26.5. It is wrong, however, to give the upper bound as 26.4 or 26.49. So, when stating an upper bound, always follow the accepted practice, as demonstrated here, which eliminates the difficulties that arise with recurring decimals.

A mathematical peculiarity

Let \( x = 0.999999… \) \( (1) \)

Multiply by 10 \( 10x = 9.999999… \) \( (2) \)

Subtract (1) from (2) \( 9x = 9 \)

Divide by 9 \( x = 1 \)

So, we have \( 0.\bar{9} = 1 \)

Hence, it is valid to give the upper bound without using recurring decimals.

EXERCISE 23B

Write down the lower and upper bounds of each of these values, rounded to the accuracy stated.

- (a) 8 m (1 significant figure)
- (b) 26 kg (2 significant figures)
- (c) 25 min (2 significant figures)
- (d) 85 g (2 significant figures)
- (e) 2.40 m (2 decimal places)
- (f) 0.2 kg (1 decimal place)
- (g) 0.06 s (2 decimal places)
- (h) 300 g (1 significant figure)
- (i) 0.7 m (1 decimal place)
- (j) 366 d (3 significant figures)
- (k) 170 weeks (2 significant figures)
- (l) 210 g (2 significant figures)

Billy has 40 identical marbles. Each marble weighs 65 g (to the nearest gram).

- (a) What is the greatest possible weight of one marble?
- (b) What is the least possible weight of one marble?
- (c) What is the greatest possible weight of all the marbles?
- (d) What is the least possible weight of all the marbles?
When we calculate an area or a volume, the errors in the linear measures will be compounded and, hence, will produce a still larger error in the calculated value. There are four operations to perform on limits – addition, subtraction, multiplication and division.

To get the maximum value when adding two numbers given to a certain limit of accuracy, the maximum values of the two numbers should be added. However, to get the maximum value when two numbers are subtracted then the lower limit of the second number should be subtracted from the upper limit of the first number.

Let $a$ and $b$ be two numbers that lie within limits $a_{\text{min}} \leq a < a_{\text{max}}$ and $b_{\text{min}} \leq b < b_{\text{max}}$

The following table shows the combinations to give the maximum and minimum values for the four rules of arithmetic.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Maximum</th>
<th>Minimum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addition $(a + b)$</td>
<td>$a_{\text{max}} + b_{\text{max}}$</td>
<td>$a_{\text{min}} + b_{\text{min}}$</td>
</tr>
<tr>
<td>Subtraction $(a - b)$</td>
<td>$a_{\text{max}} - b_{\text{min}}$</td>
<td>$a_{\text{min}} - b_{\text{max}}$</td>
</tr>
<tr>
<td>Multiplication $(a \times b)$</td>
<td>$a_{\text{max}} \times b_{\text{max}}$</td>
<td>$a_{\text{min}} \times b_{\text{min}}$</td>
</tr>
<tr>
<td>Division $(a \div b)$</td>
<td>$a_{\text{max}} \div b_{\text{min}}$</td>
<td>$a_{\text{min}} \div b_{\text{max}}$</td>
</tr>
</tbody>
</table>

Be very careful about the order when doing subtraction or division.

When solving problems involving limits, start by writing down the limits of the variables involved, as this will get you some credit in the exam, then think about which combination of limits is needed to get the required answer.

Sometimes, especially when dividing, the upper and lower limits will be given to many decimal places. Be careful where rounding these off as the rounded answer may be outside the acceptable range of the limits. If you do round answers off, give your answer to at least 3 significant figures.
for each of these rectangles, find the limits of accuracy of the area. the measurements are shown to
the level of accuracy indicated in brackets.

a 5 cm × 9 cm (nearest cm)
b 4.5 cm × 8.4 cm (1 decimal place)
c 7.8 cm × 18 cm (2 significant figures)

2 a rectangular garden has sides of 6 m and 4 m, measured to the nearest metre.
   a write down the limits of accuracy for each length.
   b what is the maximum area of the garden?
   c what is the minimum perimeter of the garden?

A cinema screen is measured as 6 m by 15 m, to the nearest metre. Calculate the limits of accuracy for the area of the screen.

The measurements, to the nearest centimetre, of a box are given as 10 cm $\times$ 7 cm $\times$ 4 cm. Calculate the limits of accuracy for the volume of the box.

The area of a field is given as 350 m$^2$, to the nearest 10 m$^2$. One length is given as 16 m, to the nearest metre. Find the limits of accuracy for the other length of the field.

In triangle $ABC$, $AB = 9$ cm, $BC = 7$ cm, and $\angle ABC = 37^\circ$. All the measurements are given to the nearest unit. Calculate the limits of accuracy for the area of the triangle.

The price of pure gold is £18.25 per gram. The density of gold is 19.3 g/cm$^3$. (Assume these figures are exact.) A solid gold bar in the shape of a cuboid has sides 4.6 cm, 2.2 cm and 6.6 cm. These measurements are made to the nearest 0.1 cm.

a  i  What are the limits of accuracy for the volume of this gold bar?
   ii  What are the upper and lower limits of the cost of this bar?

The gold bar was weighed and given a value of 1296 g, to the nearest gram.

b  What are the upper and lower limits for the cost of the bar now?.

c  Explain why the price ranges are so different.

A stopwatch records the time for the winner of a 100-metre race as 14.7 seconds, measured to the nearest one-tenth of a second.

a  What are the greatest and least possible times for the winner?

b  The length of the 100-metre track is correct to the nearest 1 m. What are the greatest and least possible lengths of the track?

c  What is the fastest possible average speed of the winner, with a time of 14.7 seconds in the 100-metre race?

A cube has a side measured as 8 cm, to the nearest millimetre. What is the greatest percentage error of the following?

a  the calculated area of one face

b  the calculated volume of the cube

A cube has a volume of 40 cm$^3$, to the nearest cm$^3$. Find the range of possible values of the side length of the cube.

A cube has a volume of 200 cm$^3$, to the nearest 10 cm$^3$. Find the limits of accuracy of the side length of the cube.

A model car travels 40 m, measured to one significant figure, at a speed of 2 m/s, measured to one significant figure. Between what limits does the time taken lie?
A school has 1850 pupils to the nearest 10.

a What is the least number of pupils at the school?

b What is the greatest number of pupils at the school?

The longest river in Britain is the River Severn. It is 220 miles long to the nearest 10 miles. What is the least length it could be?

Jerry measures a piece of wood as 60 cm correct to the nearest centimetre.

a Write down the minimum possible length of the piece of wood.

b Write down the maximum possible length of the piece of wood.

Edexcel, Question 1, Paper 13A Higher, March 2005

The base of a triangle is 10 cm measured to the nearest centimetre. The area of the triangle is 100 cm² measured to the nearest square centimetre. Calculate the least and greatest values of the height of the triangle.

A circle has an area of 70 cm², measured to the nearest square centimetre. What is the lower bound of the radius?

x = 1.8 measured to 1 decimal place,
y = 4.0 measured to 2 significant figures,
z = 2.56 measured to 3 significant figures.
Calculate the upper limit of \( \frac{x^2 + y}{z} \).

Correct to 2 significant figures, the area of a rectangle is 470 cm².
Correct to 2 significant figures, the length of the rectangle is 23 cm.
Calculate the upper bound for the width of the rectangle.

Edexcel, Question 5, Paper 13B Higher, March 2004

A girl runs 60 metres in a time of 8.0 seconds. The distance is measured to the nearest metre and the time is measured to 2 significant figures.

What is the least possible speed?

Elliot did an experiment to find the value of \( g \) m/s², the acceleration due to gravity. He measured the time, \( T \) seconds, that a block took to slide \( L \) m down a smooth slope of angle \( x^\circ \).

He then used the formula \( g = \frac{2L}{T^2 \sin x^\circ} \) to calculate an estimate for \( g \).

\( T = 1.3 \) correct to 1 decimal place.
\( L = 4.50 \) correct to 2 decimal places.
\( x = 30 \) correct to the nearest integer.

a Calculate the lower bound and the upper bound for the value of \( g \). Give your answers correct to 3 decimal places.

b Use your answers to part a to write down the value of \( g \) to a suitable degree of accuracy. Explain your reasoning.

Edexcel, Question 16, Paper 6 Higher, June 2003

a Calculate the length of the diagonal \( x \) in this cube of side 3 m.

b A man is carrying a pole of length 5 m down a long corridor. The pole is measured to the nearest centimetre. At the end of the corridor is a right-angled corner. The corridor is 3 m wide and 3 m high, both measurements correct to the nearest 10 cm. Will the pole be certain to get round the corner?
WORKED EXAM QUESTION

The magnification of a lens is given by the formula

\[ m = \frac{v}{u} \]

In an experiment, \( u \) is measured as 8.5 cm and \( v \) is measured as 14.0 cm, both correct to the nearest 0.1 cm. Find the least possible value of \( m \), You must show full details of your calculation.

Solution

Write down the limits of both variables.

\[ 8.45 \leq u < 8.55 \]
\[ 13.95 \leq v < 14.05 \]

As the calculation is a division the least value will be given by least \( u \) ÷ greatest \( v \).

Least \( m = \) least \( u \) ÷ greatest \( v \) = 8.45 ÷ 14.05 = 0.6014234875

Round off to a suitable degree of accuracy.

\[ = 0.601 \text{ or } 0.6 \]

A long rod with a square cross-section is made with a side of 5 cm. A circular hole is drilled with a radius of 3.6 cm. All measurements are to the nearest \( \frac{1}{10} \) cm. Will the rod fit into the circle?

Solution

This is a using and applying maths question. You need to have a strategy to solve it. Step 1: find the largest possible diagonal of the square using Pythagoras. Step 2: work out the smallest possible diameter of the circle. Step 3: Compare the values to see if the diagonal is smaller than the diameter. Always start with writing down the limits of the variables in the question.

Limits of side of square

\[ 4.95 < \text{side} < 5.05 \]

Limits of radius

\[ 3.55 < \text{radius} < 3.65 \]

Largest diagonal = \( \sqrt{(5.05^2 + 5.05^2)} \)

\[ = 7.14177849 \]

\[ = 7.142 \text{ (4 significant figures)} \]

Smallest diameter = \( 2 \times 3.55 = 7.1 \)

As 7.142 > 7.1, the rod may not fit in the circle.

Step 1: Work out the largest possible diagonal, do not round off to less than 4 significant figures.

Step 2: Work out the smallest diameter.

Step 3: Compare the results.
Mr Slater buys a new house. He decides to put laminate flooring throughout the whole ground floor. The laminate flooring he has chosen comes in packs, which cover 2 m². Each room also needs an edging strip around the perimeter of the room, excluding doorways. The edging comes in packs, which have a total length of 12 m.

The hall and bathroom are to have beech laminate flooring, and the other rooms oak.

Mr Slater works out the upper and lower bound for each length shown on the sketch. He then calculates the maximum floor area of each room and the maximum length of edging needed for every room. Help him complete the table to find the total maximum floor area and edging he needs.

### Beech effect

VAT is 17⅞%.

What is the total price, exclusive of VAT?
GRADE YOURSELF

- Able to find measures of accuracy for numbers given to whole number accuracies
- Able to find measures of accuracy for numbers given to decimal place or significant figure accuracies
- Able to calculate the limits of compound measures

What you should know now

- How to find the limits of numbers given to various accuracies
- How to find the limits of compound measures by combining the appropriate limits of the variables involved
This chapter will show you ...

- how to solve a linear inequality
- how to find a region on a graph that obeys a linear inequality in two variables
- how inequalities can be used to represent and solve problems

Visual overview

What you should already know

- How to solve linear equations
- How to draw linear graphs

Quick check ➔ ANSWERS

1 Solve these equations.

   a \[ \frac{2x + 5}{3} = 7 \]
   b \[ 2x - 7 = 13 \]

2 On a grid with \( x \) and \( y \) axes from 0 to 10, draw the graphs of these equations.

   a \[ y = 3x + 1 \]
   b \[ 2x + 3y = 12 \]
24.1 Solving inequalities

Inequalities behave similarly to equations which you have already met. In the case of linear inequalities, we use the same rules to solve them as we use for linear equations. There are four inequality signs, < which means “less than”, > which means “greater than”, ≤ which means “less than or equal to” and ≥ which means “greater than or equal to”.

**EXAMPLE 1**

Solve \(2x + 3 < 14\).

This is rewritten as: \(2x < 14 - 3\)

\(2x < 11\)

Divide both sides by 2:

\(\frac{2x}{2} < \frac{11}{2}\)

\(\Rightarrow x < 5.5\)

This means that \(x\) can take any value below 5.5 but not the value 5.5.

**Note:** The inequality sign given in the problem is the sign to give in the answer.

**EXAMPLE 2**

Solve \(\frac{x}{2} + 4 \geq 13\).

Solve just like an equation but leave the inequality sign in place of the equals sign.

Subtract 4 from both sides:

\(\frac{x}{2} \geq 9\)

Multiply both sides by 2:

\(x \geq 18\)

This means that \(x\) can take any value above and including 18.
EXAMPLE 3

Solve \( \frac{3x + 7}{2} < 14 \).

This is rewritten as: \( 3x + 7 < 14 \times 2 \)

That is: \( 3x + 7 < 28 \)

\( \Rightarrow 3x < 28 - 7 \)

\( \Rightarrow 3x < 21 \)

\( \Rightarrow x < 21 \div 3 \)

\( \Rightarrow x < 7 \)

EXAMPLE 4

Solve \( 1 < 3x + 4 \leq 13 \).

Divide the inequality into two parts, and treat each part separately.

\[ \begin{align*}
1 &< 3x + 4 \\
3x + 4 &\leq 13 \\
\Rightarrow 1 - 4 &< 3x \\
\Rightarrow -3 &< 3x \\
\Rightarrow -1 &< x \\
\Rightarrow -\frac{1}{3} &< x \\
\end{align*} \]

\[ \begin{align*}
3x + 4 &\leq 13 \\
\Rightarrow 3x &\leq 13 - 4 \\
\Rightarrow 3x &\leq 9 \\
\Rightarrow x &\leq \frac{9}{3} \\
\Rightarrow x &\leq 3 \\
\end{align*} \]

Hence, \( -1 < x \leq 3 \).

EXERCISE 24A

\[ \begin{align*}
\text{a} & \quad x + 4 < 7 \\
\text{b} & \quad t - 3 > 5 \\
\text{c} & \quad p + 2 \geq 12 \\
\text{d} & \quad 2x - 3 < 7 \\
\text{e} & \quad 4y + 5 \leq 17 \\
\text{f} & \quad 3x - 4 > 11 \\
\text{g} & \quad \frac{x}{2} + 4 < 7 \\
\text{h} & \quad \frac{y}{5} + 3 \leq 6 \\
\text{i} & \quad \frac{r}{3} - 2 \geq 4 \\
\text{j} & \quad 3(x - 2) < 15 \\
\text{k} & \quad 5(2x + 1) \leq 35 \\
\text{l} & \quad 2(t - 3) \geq 34 \\
\end{align*} \]

Write down the largest integer value of \( x \) that satisfies each of the following.

\[ \begin{align*}
\text{a} & \quad x - 3 \leq 5, \text{ where } x \text{ is positive} \\
\text{b} & \quad x + 2 < 9, \text{ where } x \text{ is positive and even} \\
\text{c} & \quad 3x - 11 < 40, \text{ where } x \text{ is a square number} \\
\text{d} & \quad 5x - 8 \leq 15, \text{ where } x \text{ is positive and odd} \\
\text{e} & \quad 2x + 1 < 19, \text{ where } x \text{ is positive and prime} \\
\end{align*} \]
Write down the smallest integer value of \( x \) that satisfies each of the following.

a. \( x - 2 \geq 9 \), where \( x \) is positive
b. \( x - 2 > 13 \), where \( x \) is positive and even
c. \( 2x - 11 \geq 19 \), where \( x \) is a square number

Solve the following linear inequalities.

a. \( 4x + 1 \geq 3x - 5 \)
b. \( 5t - 3 \leq 2t + 5 \)
c. \( 3y - 12 \leq y - 4 \)
d. \( 2x + 3 \geq x + 1 \)
e. \( 5w - 7 \leq 3w + 4 \)
f. \( 2(4x - 1) \leq 3(x + 4) \)

Solve the following linear inequalities.

a. \( \frac{x + 4}{2} \leq 3 \)
b. \( \frac{x - 3}{5} > 7 \)
c. \( \frac{2x + 5}{3} < 6 \)
d. \( \frac{4x - 3}{5} \geq 5 \)
e. \( \frac{3y - 2}{7} > 4 \)
f. \( \frac{5y + 3}{5} \leq 2 \)

Solve the following linear inequalities.

a. \( 7 < 2x + 1 < 13 \)
b. \( 5 < 3x - 1 < 14 \)
c. \( -1 < 5x + 4 \leq 19 \)
d. \( 1 \leq 4x - 3 < 13 \)
e. \( 11 \leq 3x + 5 \leq 17 \)
f. \( -3 \leq 2x - 3 \leq 7 \)

The number line

The solution to a linear inequality can be shown on the number line by using the following conventions.

Below are five examples.

\[
\begin{array}{c}
\text{represents } x < 3 \\
\text{represents } x \leq -2 \\
\text{represents } -1 \leq x < 2
\end{array}
\]
EXAMPLE 5

a Write down the inequality shown by this diagram.

\[ 2x + 3 < 11 \]

b i Solve the following inequality \( 2x + 3 < 11 \).
ii Mark the solution on a number line.

c Write down the integers that satisfy both the inequalities in a and b.

a The inequality shown is \( x \geq 1 \).
b i \( 2x + 3 < 11 \) ⇒ \( 2x < 8 \) ⇒ \( x < 4 \)
ii
\[ 0 \quad 1 \quad 2 \quad 3 \quad 4 \]

c The integers that satisfy both inequalities are 1, 2 and 3.

EXERCISE 24B

1 Write down the inequality that is represented by each diagram below.

2 Draw diagrams to illustrate the following.

3 Solve the following inequalities and illustrate their solutions on number lines.

4 Solve the following inequalities and illustrate their solutions on number lines.
Inequalities involving $x^2$

When we have an inequality such as $x^2 < 9$, we have to think very carefully because there are two possible solutions to $x^2 = 9$. They are $x = 3$ and $x = -3$.

The solution $x = 3$ to the equation $x^2 = 9$ would suggest the condition $x < 3$ is a solution to $x^2 < 9$. Clearly, $x < 3$ does satisfy the inequality $x^2 < 9$. The condition to be obtained from the solution $x = -3$ is not $x < -3$. (Think about $(-5)^2$.) So it must be $x > -3$. That is, the inequality sign is changed. For convenience, $x > -3$ can be turned to give $-3 < x$.

Show this situation on a number line and the solution becomes clear.

Namely, $-3 < x < 3$.

**EXAMPLE 6**

Solve the inequality $x^2 > 16$ and show your solution on a number line.

The solution to $x^2 > 16$ will be $x > 4$ and $x < -4$, which is represented as

Notice the difference between inequalities of the type $x^2 < a^2$ and those of the type $x^2 > a^2$.

**EXERCISE 24C**

Solve the following inequalities, showing their solutions on number lines.

1. $x^2 \leq 4$
2. $x^2 > 25$
3. $x^2 < 49$
4. $x^2 \geq 1$
5. $x^2 \geq 9$
6. $x^2 - 1 > 8$
7. $x^2 + 2 \leq 6$
8. $x^2 - 3 < 13$
9. $x^2 + 5 > 6$
10. $x^2 - 4 \geq 5$
11. $2x^2 - 1 > 7$
12. $3x^2 - 5 < 22$
13. $5x^2 + 3 \leq 8$
14. $2x^2 - 4 < 28$
15. $3x^2 - 9 \geq 66$
16. $x^2 \geq 100$
17. $x^2 < 2.25$
18. $x^2 - 5 \leq 76$
19. $x^2 > 0$
20. $x^2 \geq 0.25$
A linear inequality can be plotted on a graph. The result is a region that lies on one side or the other of a straight line. You will recognise an inequality by the fact that it looks like an equation but instead of the equals sign it has an inequality sign: <, >, ≤, or ≥.

The following are examples of linear inequalities which can be represented on a graph.

\[
\begin{align*}
y &< 3 \\
x &> 7 \\
-3 &\leq y < 5 \\
y &\geq 2x + 3 \\
2x + 3y &< 6 \\
y &\leq x
\end{align*}
\]

The method for graphing an inequality is to draw the boundary line that defines the inequality. This is found by replacing the inequality sign with an equals sign. When a strict inequality is stated (< or >), the boundary line should be drawn as a dashed line to show that it is not included in the range of values.

When ≤ or ≥ are used to state the inequality, the boundary line should be drawn as a solid line to show that the boundary is included.

After the boundary line has been drawn, the required region is shaded.

To confirm on which side of the line the region lies, choose any point that is not on the boundary line and test it in the inequality. If it satisfies the inequality, that is the side required. If it doesn’t, the other side is required.

Work through the six inequalities on this page and the next, to see how the procedure is applied.

**EXAMPLE 7**

Show each of the following inequalities on a graph.

\[a \quad y \leq 3 \quad b \quad x > 7 \quad c \quad -3 \leq y < 5 \quad d \quad y \geq 2x + 3 \quad e \quad 2x + 3y < 6 \quad f \quad y \leq x\]

**a**

Draw the line \( y = 3 \). Since the inequality is stated as \( \leq \), the line is solid. Test a point that is not on the line.

The origin is always a good choice if possible, as \( O \) is easy to test.

Putting \( O \) into the inequality gives \( O \leq 3 \). The inequality is satisfied and so the region containing the origin is the side we want.

Shade it in.
b Since the inequality is stated as $>$, the line is dashed.
Draw the line $x = 7$.
Test the origin $(0, 0)$, which gives $0 > 7$. This is not true, so we want the other side of the line from the origin.
Shade it in.

c Draw the lines $y = -3$ (solid for $\leq$) and $y = 5$ (dashed for $<$).
Test a point that is not on either line, say $(0, 0)$.
Zero is between $-3$ and $5$, so the required region lies between the lines.
Shade it in.

d Draw the line $y = 2x + 3$. Since the inequality is stated as $\leq$, the line is solid.
Test a point that is not on the line, $(0, 0)$. Putting these $x$ and $y$-values in the inequality gives $0 \leq 2(0) + 3$, which is true. So the region that includes the origin is what we want.
Shade it in.

e Draw the line $2x + 3y = 6$. Since the inequality is stated as $<$, the line is dashed.
Test a point that is not on the line, say $(0, 0)$.
Is it true that $2(0) + 3(0) < 6$? The answer is yes, so the origin is in the region that we want.
Shade it in.

f Draw the line $y = x$. Since the inequality is stated as $\leq$, the line is solid.
This time the origin is on the line, so pick any other point, say $(1, 3)$. Putting $x = 1$ and $y = 3$ in the inequality gives $3 \leq 1$. This is not true, so the point $(1, 3)$ is not in the region we want.
Shade in the other side to $(1, 3)$. 
More than one inequality

When we have to show a region that satisfies more than one inequality, it is clearer to shade the regions not required, so that the required region is left blank.

**EXAMPLE 8**

a On the same grid, show the regions that represent the following inequalities by shading the unwanted regions.

i $x > 2$

ii $y \geq x$

iii $x + y < 8$

b Are the points (3, 4), (2, 6) and (3, 3) in the region that satisfies all three inequalities?

abi This region is shown unshaded in diagram i.

The boundary line is $x = 2$ (dashed).

bii This region is shown unshaded in diagram II.

The boundary line is $y = x$ (solid).

biii This region is shown unshaded in diagram III.

The boundary line is $x + y = 8$ (dashed). The regions have first been drawn separately so that each may be clearly seen. The diagram on the right shows all three regions on the same grid. The white triangular area defines the region that satisfies all three inequalities.

b i The point (3, 4) is clearly within the region that satisfies all three inequalities.

ii The point (2, 6) is on the boundary lines $x = 2$ and $x + y = 8$. As these are dashed lines, they are not included in the region defined by all three inequalities. So, the point (2, 6) is not in this region.

iii The point (3, 3) is on the boundary line $y = x$. As this is a solid line, it is included in the region defined by all three inequalities. So, the point (3, 3) is included in this region.

**EXERCISE 24D**

**a** Draw the line $x = 2$ (as a solid line).

**b** Shade the region defined by $x \leq 2$.

**c** Draw the line $y = -3$ (as a dashed line).

**d** Shade the region defined by $y > -3$. 
3. **a** Draw the line \( x = -2 \) (as a solid line).
   **b** Draw the line \( x = 1 \) (as a solid line) on the same grid.
   **c** Shade the region defined by \(-2 \leq x \leq 1\).

4. **a** Draw the line \( y = -1 \) (as a dashed line).
   **b** Draw the line \( y = 4 \) (as a solid line) on the same grid.
   **c** Shade the region defined by \(-1 \leq y \leq 4\).

5. **a** On the same grid, draw the regions defined by these inequalities.
   - \(-3 \leq x \leq 6\)
   - \(-4 < y \leq 5\)
   **b** Are the following points in the region defined by both inequalities?
   - (2, 2)
   - (1, 5)
   - (–2, –4)

6. **a** Draw the line \( y = 2x - 1 \) (as a dashed line).
   **b** Shade the region defined by \( y < 2x - 1 \).

7. **a** Draw the line \( 3x - 4y = 12 \) (as a solid line).
   **b** Shade the region defined by \( 3x - 4y \leq 12 \).

8. **a** Draw the line \( y = \frac{1}{2}x + 3 \) (as a solid line).
   **b** Shade the region defined by \( y \geq \frac{1}{2}x + 3 \).

Shade the region defined by \( y < -3 \).

9. **a** Draw the line \( y = 3x - 4 \) (as a solid line).
   **b** Draw the line \( x + y = 10 \) (as a solid line) on the same diagram.
   **c** Shade the diagram so that the region defined by \( y \geq 3x - 4 \) is left unshaded.
   **d** Shade the diagram so that the region defined by \( x + y \leq 10 \) is left unshaded.
   **e** Are the following points in the region defined by both inequalities?
   - (2, 1)
   - (2, 2)
   - (2, 3)

10. **a** Draw the line \( y = x \) (as a solid line).
    **b** Draw the line \( 2x + 5y = 10 \) (as a solid line) on the same diagram.
    **c** Draw the line \( 2x + y = 6 \) (as a dashed line) on the same diagram.
    **d** Shade the diagram so that the region defined by \( y \geq x \) is left unshaded.
    **e** Shade the diagram so that the region defined by \( 2x + 5y \geq 10 \) is left unshaded.
    **f** Shade the diagram so that the region defined by \( 2x + y < 6 \) is left unshaded.
    **g** Are the following points in the region defined by these inequalities?
    - (1, 1)
    - (2, 2)
    - (1, 3)
Chapter 24: Inequalities and Regions

24.3 Problem solving

This section will show you:
- some of the problems that can be solved using inequalities

Inequalities can arise in the solution of certain kinds of problem. The next example illustrates such a situation.

### Example 9

James has to buy drinks for himself and four friends. He has £2.50 to spend. A can of Cola costs 60 pence and a can of Orange costs 40 pence. He buys \( x \) cans of Cola and \( y \) cans of Orange.

a Explain why
i \( x + y \geq 5 \)
ii \( 60x + 40y \leq 25 \)

b Write down all the possible numbers of each type of drink he can buy.

a i James needs to buy at least five cans as there are five people. So the total number of cans of Cola and Orange must be at least five. This is expressed as \( x + y \geq 5 \).

ii \( x \) cans of Cola cost \( 60x \) pence, and \( y \) cans of Orange cost \( 40y \) pence. So the total cost is \( 60x + 40y \).

But he has only 250 pence to spend, so total cost cannot exceed 250 pence. Hence, \( 60x + 40y \leq 250 \).

This cancels through by 10 to give \( 6x + 4y \leq 25 \).

b By trying different values of \( x \) and \( y \), the following four combinations are found to satisfy the condition.

- one can of Cola and four cans of Orange
- two cans of Cola and three cans of Orange
- five or six cans of Orange
A company sells two types of bicycle, the Chapper and the Graffiti. A Chapper costs £148 and a Graffiti cost £125.

a How much do x Chappers cost?

b How much do y Graffitis cost?

c How much do x Chappers and y Graffitis cost altogether?

A computer firm makes two types of machine. The Z210 and the Z310. The price of the Z210 is £A and that of the Z310 is £B. How much are the following?

a x Z210s and y Z310s

b x Z210s and twice as many Z310s

c 9 Z210s and (9 + y) Z310s

If x + y > 40, which of the following may be true?

a x > 40

b x + y ≤ 20

c x − y = 10

d x ≤ 5

A bookshelf holds P paperback and H hardback books. The bookshelf can hold a total of 400 books. Which of the following may be true?

a P + H < 300

b P ≥ H

c P + H > 500

A school uses two coach firms, Excel and Storm, to take pupils home from school. An Excel coach holds 40 pupils and a Storm coach holds 50 pupils. 1500 pupils need to be taken home by coach. If E Excel coaches and S Storm coaches are used, explain why:

4E + 5S ≥ 150

A boy goes to the fair with £6.00 in his pocket. He only likes rides on the big wheel and eating hot-dogs. A big wheel ride costs £1.50 and a hot-dog costs £2.00. He has W big wheel rides and D hot-dogs. Explain why:

a W ≤ 4

b D ≤ 3

c 3W + 4D ≤ 12

d If he cannot eat more than two hot-dogs without being ill, write down an inequality that must be true.

e Which of these combinations of big wheel rides and hot-dogs are possible if they obey all of the above conditions?

i two big wheel rides and one hot-dog

ii three big wheel rides and two hot-dogs

iii two big wheel rides and two hot-dogs

iv one big wheel ride and one hot-dog
**7** Pens cost 45p each and pencils cost 25p each. Jane has £2.00 with which to buy pens and pencils. She buys $x$ pens and $y$ pencils.

a. Write down an inequality that must be true.

b. She must have at least two more pencils than pens. Write down an inequality that must be true.

**8** Mushtaq has to buy some apples and some pears. He has £3.00 to spend. Apples cost 30p each and pears cost 40p each. He must buy at least two apples and at least three pears, and at least seven fruits altogether. He buys $x$ apples and $y$ pears.

a. Explain each of these inequalities.

i. $3x + 4y \leq 30$

ii. $x \geq 2$

iii. $y \geq 3$

iv. $x + y \geq 7$

b. Which of these combinations satisfy all of the above inequalities?

i. three apples and three pears

ii. four apples and five pears

iii. no apples and seven pears

iv. three apples and five pears

**9** A shop decides to stock only sofas and beds. A sofa takes up 4 m$^2$ of floor area and is worth £300. A bed takes up 3 m$^2$ of floor area and is worth £500. The shop has 48 m$^2$ of floor space for stock. The insurance policy will allow a total of only £6000 of stock to be in the shop at any one time. The shop stocks $x$ sofas and $y$ beds.

a. Explain each of these inequalities.

i. $4x + 3y \leq 48$

ii. $3x + 5y \leq 60$

b. Which of these combinations satisfy both of the above inequalities?

i. ten sofas and no beds

ii. eight sofas and six beds

iii. ten sofas and five beds

iv. six sofas and eight beds

**10** The 300 pupils in Year 7 are to go on a trip to Adern Towers theme park. The local bus company has six 40-seat coaches and five 50-seat coaches. The school hires $x$ 40-seat coaches and $y$ 50-seat coaches.

a. Explain each of these inequalities.

i. $4x + 5y \geq 30$

ii. $x \leq 6$

iii. $y \leq 5$

b. Check that each of these combinations obeys each of the inequalities above.

i. six 40-seaters and two 50-seaters

ii. two 40-seaters and five 50-seaters

iii. four 40-seaters and three 50-seaters

iv. three 40-seaters and four 50-seaters

c. The cost of hiring each coach is £100 for a 40-seater and £120 for a 50-seater. Which of the combinations in part b would be the cheapest option?

d. There is one combination that is even cheaper than the answer to part c. What is it?
$n$ is a whole number such that $7 \leq 3n < 15$

List all the possible values of $n$.

**Edexcel, Question 2, Paper 13A Higher, January 2004**

a Solve the inequality $4x + 3 < 13$

b Write down the largest integer that is a solution of $4x + 3 < 13$

**Edexcel, Question 2, Paper 13A Higher, January 2003**

a Solve the inequality $5x - 9 > 6$

b i Solve the inequality $2x + 7 > 15 - 3x$

ii If $x$ is an integer, what is the smallest possible value of $x$?

Find all the integer values of $n$ that satisfy the inequality $-3 \leq 2n + 1 < 9$

**Edexcel, Question 4, Paper 5 Higher, June 2003**

Copy the grid below and indicate clearly on it the region defined by the three inequalities

- $y \leq 5$
- $x \geq -2$
- $y \geq 2x - 1$

Mark the region with an $R$.

$n$ is an integer that satisfies the inequality $\frac{121}{n^2} \geq 8$

List all the possible values of $n$. 

On a grid show the region that is defined by the three inequalities

- $x > 1$
- $y \leq 3$
- $x + y \leq 5$

Mark the region with an $R$.

On a grid show the region that is defined by the three inequalities

- $x > 0$
- $y \leq 2x + 1$
- $x + y \leq 4$

Mark the region with an $R$.

a $-2 < x < 1$

$x$ is an integer.

Write down all the possible values of $x$.

b $-2 < x < 1$

$y > -2$

$y < x + 1$

$x$ and $y$ are integer.

On a copy of the grid, mark with a cross ($\times$), each of the six points which satisfies all these 3 inequalities.
WORKED EXAM QUESTION

**a** On the number lines show the inequalities

- i \(-2 \leq n < 4\)
- ii \(n < 2\)

**b** \(n\) is an integer. Find the values of \(n\) that satisfy both inequalities in part **a**

**c** Solve the inequalities

- i \(3x + 8 > 2\)
- ii \(3(x - 4) \leq \frac{1}{2}(x + 1)\)

### Solution

**a**

- i \(-2, -1, 0, 1\)  
  - Remember that a strict inequality has an open circle to show the boundary and an inclusive inequality has a solid circle to show the boundary.

- ii \(-4, -3, -2, -1, 0, 1, 2, 3, 4, 5\)  
  - The integers that satisfy both inequalities are in the overlap of both lines.

**b** \(-2, -1, 0, 1\)

**c**

- i \(3x + 8 > 2\)  
  - As when solving an equation do the same thing to both sides. First subtract 8, then divide by 3.
  
  \(3x > -6\)  
  \(x > -2\)

- ii \(3(x - 4) \leq \frac{1}{2}(x + 1)\)  
  - First multiply by 2 to get rid of the fraction, then expand the brackets. Then collect all the \(x\) terms on the left-hand side and the number terms on the right-hand side. Then simplify and divide by 5.

\(6x - 24 \leq x + 1\)  
\(6x - x \leq 25\)  
\(5x \leq 25\)  
\(x \leq 5\)
GRADE YOURSELF

Able to solve inequalities such as $3x + 2 < 5$ and represent the solution on a number line

Able to represent a region that satisfies a linear inequality graphically, and to solve more complex linear inequalities

Able to represent a region that simultaneously satisfies more than one linear inequality graphically

Able to translate a problem into inequalities

What you should know now

- How to solve simple inequalities
- How to create algebraic inequalities from verbal statements
- How to represent linear inequalities on a graph
- How to depict a region satisfying more than one linear inequality
This chapter will show you ...

- the properties of vectors
- how to add and subtract vectors
- how to use vectors to solve geometrical problems

Visual overview

What you should already know

- Vectors are used to describe translations

Quick check

Use column vectors to describe these translations.

- \( a \) A to C
- \( b \) B to D
- \( c \) C to D
- \( d \) D to E
A vector is a quantity which has both magnitude and direction. It can be represented by a straight line which is drawn in the direction of the vector and whose length represents the magnitude of the vector. Usually, the line includes an arrowhead.

The translation or movement from A to B is represented by the vector \( \mathbf{a} \).

\( \mathbf{a} \) is always printed in bold type, but is written as \( \vec{a} \).

\( \mathbf{a} \) can also be written as \( \overrightarrow{AB} \).

A quantity which is completely described by its magnitude, and has no direction associated with it, is called a scalar. The mass of a bus (10 tonnes) is an example of a scalar. Another example is a linear measure, such as 25.4 mm.

Multiplying a vector by a number (scalar) alters its magnitude (length) but not its direction. For example, the vector \( 2\mathbf{a} \) is twice as long as the vector \( \mathbf{a} \), but in the same direction.

A negative vector, for example \( -\mathbf{b} \), has the same magnitude as the vector \( \mathbf{b} \), but is in the opposite direction.

Addition and subtraction of vectors

Take two non-parallel vectors \( \mathbf{a} \) and \( \mathbf{b} \), then \( \mathbf{a} + \mathbf{b} \) is defined to be the translation of \( \mathbf{a} \) followed by the translation of \( \mathbf{b} \). This can easily be seen on a vector diagram.
Similarly, \( a - b \) is defined to be the translation of \( a \) followed by the translation of \(-b\).

Look at the parallelogram grid below. \( a \) and \( b \) are two independent vectors that form the basis of this grid. It is possible to define the position, with reference to \( O \), of any point on this grid by a vector expressed in terms of \( a \) and \( b \). Such a vector is called a position vector.

For example, the position vector of \( K \) is \( \overrightarrow{OK} \) or \( k = 3a + b \), the position vector of \( E \) is \( \overrightarrow{OE} \) or \( e = 2b \). The vector \( \overrightarrow{HT} = 3a + b \), the vector \( \overrightarrow{PN} = a - b \), the vector \( \overrightarrow{MK} = 2a - 2b \), and the vector \( \overrightarrow{TP} = -a - b \).

Note \( \overrightarrow{OK} \) and \( \overrightarrow{HT} \) are called equal vectors because they have exactly the same length and are in the same direction. \( \overrightarrow{MK} \) and \( \overrightarrow{PN} \) are parallel vectors but \( \overrightarrow{MK} \) is twice the magnitude of \( \overrightarrow{PN} \).

**EXAMPLE 1**

**a** Using the grid above, write down the following vectors in terms of \( a \) and \( b \).

i \( \overrightarrow{BH} \)

ii \( \overrightarrow{HP} \)

iii \( \overrightarrow{GT} \)

iv \( \overrightarrow{T1} \)

v \( \overrightarrow{FH} \)

vi \( \overrightarrow{BQ} \)

**b** What is the relationship between the following vectors?

i \( \overrightarrow{BH} \) and \( \overrightarrow{GT} \)

ii \( \overrightarrow{BQ} \) and \( \overrightarrow{GT} \)

iii \( \overrightarrow{HP} \) and \( \overrightarrow{T1} \)

**c** Show that \( B \), \( H \) and \( Q \) lie on the same straight line.

**a** i \( a + b \) ii \( 2a \) iii \( 2a + 2b \) iv \( -4a \) v \( -2a + 2b \) vi \( 2a + 2b \)

**b** i \( \overrightarrow{BH} \) and \( \overrightarrow{GT} \) are parallel and \( \overrightarrow{GT} \) is twice the length of \( \overrightarrow{BH} \.

ii \( \overrightarrow{BQ} \) and \( \overrightarrow{GT} \) are equal.

iii \( \overrightarrow{HP} \) and \( \overrightarrow{T1} \) are in opposite directions and \( \overrightarrow{T1} \) is twice the length of \( \overrightarrow{HP} \.

**c** \( \overrightarrow{BH} \) and \( \overrightarrow{BQ} \) are parallel and start at the same point \( B \). Therefore, \( B \), \( H \) and \( Q \) must lie on the same straight line.
On this grid, $\overrightarrow{OA}$ is $a$ and $\overrightarrow{OB}$ is $b$.

- Name three other vectors equivalent to $a$.
- Name three other vectors equivalent to $b$.
- Name three vectors equivalent to $-a$.
- Name three vectors equivalent to $-b$.

Using the same grid as in question 1, give the following vectors in terms of $a$ and $b$.

- $\overrightarrow{OC}$
- $\overrightarrow{OE}$
- $\overrightarrow{OD}$
- $\overrightarrow{OG}$
- $\overrightarrow{OJ}$
- $\overrightarrow{OH}$
- $\overrightarrow{AG}$
- $\overrightarrow{AK}$
- $\overrightarrow{BK}$
- $\overrightarrow{DJ}$
- $\overrightarrow{DK}$

What do the answers to parts 2c and 2g tell you about the vectors $\overrightarrow{OD}$ and $\overrightarrow{AG}$?

On the grid in question 1, there are three vectors equivalent to $\overrightarrow{OG}$. Name all three.

What do the answers to parts 2c and 2e tell you about vectors $\overrightarrow{OD}$ and $\overrightarrow{OJ}$?

On the grid in question 1, there is one other vector that is twice the size of $\overrightarrow{OD}$. Which is it?

On the grid in question 1, there are three vectors that are three times the size of $\overrightarrow{OA}$. Name all three.
On a copy of this grid, mark on the points C to P
to show the following.

\[ \overrightarrow{OC} = 2a + 3b \]
\[ \overrightarrow{OD} = 2a + b \]
\[ \overrightarrow{OE} = a + 2b \]
\[ \overrightarrow{OF} = 3b \]
\[ \overrightarrow{OG} = 4 \]
\[ \overrightarrow{OH} = 4a + 2b \]
\[ \overrightarrow{OI} = 3a + 3b \]
\[ \overrightarrow{OJ} = a + b \]
\[ \overrightarrow{OK} = 2a + 2b \]
\[ \overrightarrow{OM} = 2a + b \]

5. On the diagram in question 5. What can you say about the points O, J, K and I?

b. How could you tell this by looking at the vectors for parts 5g, 5h and 5i?

c. There is another point on the same straight line as O and D. Which is it?

d. Copy and complete these statements and then mark the appropriate points on the diagram you drew for question 5.

i. The point Q is on the straight line ODH. The vector \( \overrightarrow{OQ} \) is given by \( \overrightarrow{OQ} = \ldots \)

ii. The point R is on the straight line ODH. The vector \( \overrightarrow{OR} \) is given by \( \overrightarrow{OR} = \ldots \)

e. Copy and complete the following statement.

Any point on the line ODH has a vector \( na + \ldots \), where \( n \) is any number.

6. a. Look at the diagram in question 5. What can you say about the points O, J, K and I?

b. How could you tell this by looking at the vectors for parts 5g, 5h and 5i?

c. There is another point on the same straight line as O and D. Which is it?

d. Copy and complete these statements and then mark the appropriate points on the diagram you drew for question 5.

7. On this grid, \( \overrightarrow{OA} \) is a and \( \overrightarrow{OB} \) is b.

Give the following vectors in terms of a and b.

\[ \overrightarrow{OH} \]
\[ \overrightarrow{OK} \]
\[ \overrightarrow{OH} \]
\[ \overrightarrow{OK} \]
\[ \overrightarrow{AK} \]
\[ \overrightarrow{DK} \]
\[ \overrightarrow{JE} \]
\[ \overrightarrow{AF} \]

8. a. What do the answers to parts 7e and 7f tell you about the vectors \( \overrightarrow{OC} \) and \( \overrightarrow{CO} \)?

b. On the grid in question 7, there are five other vectors opposite to \( \overrightarrow{OC} \). Name at least three.

9. a. What do the answers to parts 7j and 7k tell you about vectors \( \overrightarrow{AB} \) and \( \overrightarrow{CK} \)?

b. On the grid in question 7, there are two vectors that are twice the size of \( \overrightarrow{AB} \) and in the opposite direction. Name both of them.

c. On the grid in question 7, there are three vectors that are three times the size of \( \overrightarrow{OA} \) and in the opposite direction. Name all three.
On a copy of this grid, mark on the points C to P to show the following.

\[ \overrightarrow{OC} = 2a - b \]
\[ \overrightarrow{OD} = 2a + b \]
\[ \overrightarrow{OE} = a - 2b \]
\[ \overrightarrow{OF} = b - 2a \]
\[ \overrightarrow{OG} = a - 2b \]
\[ \overrightarrow{OH} = b - 2a \]
\[ \overrightarrow{OI} = 2a - 2b \]
\[ \overrightarrow{OJ} = -a + b \]
\[ \overrightarrow{OK} = -a - b \]
\[ \overrightarrow{OM} = -a - 2b \]
\[ \overrightarrow{OP} = 3a - 3b \]

This grid shows the vectors \( \overrightarrow{OA} = a \) and \( \overrightarrow{OB} = b \).

a. Name three vectors equivalent to \( a + b \).

b. Name three vectors equivalent to \( a - b \).

c. Name three vectors equivalent to \( b - a \).

d. Name three vectors equivalent to \( -a + b \).

e. Name three vectors equivalent to \( 2a - b \).

f. Name three vectors equivalent to \( 2b - a \).

g. For each of these, name one equivalent vector.

i. \( 3a - b \)

ii. \( 2(a + b) \)

iii. \( 3a - 2b \)

iv. \( 3(a - b) \)

v. \( 3(b - a) \)

vi. \( 3(a + b) \)

vii. \( -3(a + b) \)

viii. \( 2a + b - 3a - 2b \)

ix. \( 2(2a - b) - 3(a - b) \)

The points P, Q and R lie on a straight line. The vector \( \overrightarrow{PQ} \) is \( 2a + b \), where \( a \) and \( b \) are vectors.

Which of the following vectors could be the vector \( \overrightarrow{PR} \) and which could not be the vector \( \overrightarrow{PR} \) (two of each).

a. \( 2a + 2b \)

b. \( 4a + 2b \)

c. \( 2a - b \)

d. \( -6a - 3b \)

The points P, Q and R lie on a straight line. The vector \( \overrightarrow{PQ} \) is \( 3a - b \), where \( a \) and \( b \) are vectors.

a. Write down any other vector that could represent \( \overrightarrow{PR} \).

b. How can you tell from the vector \( \overrightarrow{PS} \) that S lies on the same straight line as P, Q and R?

Use the diagram in question 11 to prove the following results.

a. KB is parallel to IE.

b. L, A and F are on a straight line.

Use a vector diagram to show that \( a + (b + c) = (a + b) + c \).
25.2 Vectors in geometry

In this section you will learn how to:

- use vectors to solve geometrical problems

Key word

vector

Vectors can be used to prove many results in geometry, as the following examples show.

**EXAMPLE 3**

In the diagram, \( \overrightarrow{OA} = \mathbf{a} \), \( \overrightarrow{OB} = \mathbf{b} \), and \( \overrightarrow{BC} = 1.5 \mathbf{a} \). M is the midpoint of BC, N is the midpoint of AC and P is the midpoint of OB.

a) Find these vectors in terms of \( \mathbf{a} \) and \( \mathbf{b} \).

i) \( \overrightarrow{AC} \)

ii) \( \overrightarrow{OM} \)

iii) \( \overrightarrow{BN} \)

b) Prove that \( \overrightarrow{PN} \) is parallel to \( \overrightarrow{OA} \).

### Solution:

**i)** You have to get from A to C in terms of vectors that you know.

\[
\overrightarrow{AC} = \overrightarrow{AO} + \overrightarrow{OB} + \overrightarrow{BC}
\]

Now \( \overrightarrow{AO} = -\overrightarrow{OA} \), so you can write

\[
\overrightarrow{AC} = -\mathbf{a} + \mathbf{b} + 1.5\mathbf{a}
\]

\[
= \mathbf{a} + \mathbf{b}
\]

Note that the letters “connect up” as we go from A to C, and that the negative of a vector represented by any pair of letters is formed by reversing the letters.

**ii)** In the same way

\[
\overrightarrow{OM} = \overrightarrow{OB} + \overrightarrow{BM} = \overrightarrow{OB} + 1.5\overrightarrow{BC}
\]

\[
= \mathbf{b} + 1.5(1.5\mathbf{a})
\]

\[
\overrightarrow{OM} = \frac{5}{2}\mathbf{a} + \mathbf{b}
\]
**EXAMPLE 4**

OACB is a parallelogram. \( \overrightarrow{OA} \) is represented by the vector \( \mathbf{a} \), \( \overrightarrow{OB} \) is represented by the vector \( \mathbf{b} \). \( P \) is a point \( \frac{2}{3} \) the distance from \( O \) to \( C \), and \( M \) is the midpoint of \( AC \). Show that \( B, P \) and \( M \) lie on the same straight line.

\[
\begin{align*}
\overrightarrow{OC} &= \overrightarrow{OA} + \overrightarrow{AC} = \mathbf{a} + \mathbf{b} \\
\overrightarrow{OP} &= \frac{2}{3} \overrightarrow{OC} = \frac{2}{3} \mathbf{a} + \frac{2}{3} \mathbf{b} \\
\overrightarrow{OM} &= \overrightarrow{OA} + \overrightarrow{AM} = \mathbf{a} + \frac{1}{2} \overrightarrow{AC} = \mathbf{a} + \frac{1}{2} \mathbf{b} \\
\overrightarrow{BP} &= \overrightarrow{BO} + \overrightarrow{OP} = -\mathbf{b} + \frac{2}{3} \mathbf{a} + \frac{2}{3} \mathbf{b} = \frac{2}{3} \mathbf{a} - \frac{1}{3} \mathbf{b} = \frac{1}{3} (2\mathbf{a} - \mathbf{b}) \\
\overrightarrow{BM} &= \overrightarrow{BO} + \overrightarrow{OM} = -\mathbf{b} + \mathbf{a} + \frac{1}{2} \mathbf{b} = \mathbf{a} - \frac{1}{2} \mathbf{b} = \frac{1}{2} (2\mathbf{a} - \mathbf{b})
\end{align*}
\]

Therefore, \( \overrightarrow{BM} \) is a multiple of \( \frac{1}{2} \overrightarrow{BP} \).

Therefore, \( \overrightarrow{BP} \) and \( \overrightarrow{BM} \) are parallel and as they have a common point, \( B \), they must lie on the same straight line.
The diagram shows the vectors \( \overrightarrow{OA} = \mathbf{a} \) and \( \overrightarrow{OB} = \mathbf{b} \). M is the midpoint of AB.

**a**

i. Work out the vector \( \overrightarrow{AB} \).

ii. Work out the vector \( \overrightarrow{AM} \).

iii. Explain why \( \overrightarrow{OM} = \overrightarrow{OA} + \overrightarrow{AM} \).

iv. Using your answers to parts ii and iii, work out \( \overrightarrow{OM} \) in terms of \( \mathbf{a} \) and \( \mathbf{b} \).

**b**

i. Work out the vector \( \overrightarrow{BA} \).

ii. Work out the vector \( \overrightarrow{BM} \).

iii. Explain why \( \overrightarrow{OM} = \overrightarrow{OB} + \overrightarrow{BM} \).

iv. Using your answers to parts ii and iii, work out \( \overrightarrow{OM} \) in terms of \( \mathbf{a} \) and \( \mathbf{b} \).

**c**

Copy the diagram and show on it the vector \( \overrightarrow{OC} \) which is equal to \( \mathbf{a} + \mathbf{b} \).

**d**

Describe in geometrical terms the position of M in relation to O, A, B and C.

The diagram shows the vectors \( \overrightarrow{OA} = \mathbf{a} \) and \( \overrightarrow{OC} = -\mathbf{b} \). N is the midpoint of AC.

**a**

i. Work out the vector \( \overrightarrow{AC} \).

ii. Work out the vector \( \overrightarrow{AN} \).

iii. Explain why
\[
\overrightarrow{ON} = \overrightarrow{OA} + \overrightarrow{AN}.
\]

iv. Using your answers to parts ii and iii, work out \( \overrightarrow{ON} \) in terms of \( \mathbf{a} \) and \( \mathbf{b} \).

**b**

i. Work out the vector \( \overrightarrow{CA} \).

ii. Work out the vector \( \overrightarrow{CN} \).

iii. Explain why
\[
\overrightarrow{ON} = \overrightarrow{OC} + \overrightarrow{CN}.
\]

iv. Using your answers to parts ii and iii, work out \( \overrightarrow{ON} \) in terms of \( \mathbf{a} \) and \( \mathbf{b} \).

**c**

Copy the diagram above and show on it the vector \( \overrightarrow{OD} \) which is equal to \( \mathbf{a} - \mathbf{b} \).

**d**

Describe in geometrical terms the position of N in relation to O, A, C and D.

Copy this diagram and on it draw vectors that represent

**a** \( \mathbf{a} + \mathbf{b} \)

**b** \( \mathbf{a} - \mathbf{b} \)
The diagram shows the vectors $\vec{OA} = a$ and $\vec{OB} = b$.

The point C divides the line AB in the ratio 1:2 (i.e. AC is $\frac{1}{3}$ the distance from A to B).

**a** i Work out the vector $\vec{AB}$.
   ii Work out the vector $\vec{AC}$.
   iii Work out the vector $\vec{OC}$ in terms of $a$ and $b$.

**b** If C now divides the line AB in the ratio 1:3 (i.e. AC is $\frac{1}{4}$ the distance from A to B), write down the vector that represents $\vec{OC}$.

The diagram shows the vectors $\vec{OA} = a$ and $\vec{OB} = b$.

The point C divides OB in the ratio 2:1 (i.e. OC is $\frac{2}{3}$ the distance from O to B). The point E is such that $\vec{OE} = 2\vec{OA}$. D is the midpoint of AB.

**a** Write down (or work out) these vectors in terms of $a$ and $b$.
   i $\vec{OC}$
   ii $\vec{OD}$
   iii $\vec{CD}$

**b** The vector $\vec{CD}$ can be written as $\vec{CD} = \vec{CO} + \vec{OD}$. Use this fact to work out $\vec{CD}$ in terms of $a$ and $b$.

**c** Write down a similar rule to that in part b for the vector $\vec{DE}$. Use this rule to work out $\vec{DE}$ in terms of $a$ and $b$.

**d** Explain why C, D and E lie on the same straight line.

ABCDEF is a regular hexagon. $\vec{AB}$ is represented by the vector $a$, and $\vec{BC}$ by the vector $b$.

**a** By means of a diagram, or otherwise, explain why $\vec{CD} = b - a$.

**b** Express these vectors in terms of $a$ and $b$.
   i $\vec{DE}$
   ii $\vec{EF}$
   iii $\vec{FA}$

**c** Work out the answer to
$\vec{AB} + \vec{BC} + \vec{CD} + \vec{DE} + \vec{EF} + \vec{FA}$

Explain your answer.

**d** Express these vectors in terms of $a$ and $b$.
   i $\vec{AD}$
   ii $\vec{BE}$
   iii $\vec{CF}$
   iv $\vec{AE}$
   v $\vec{DF}$
ABCDEFGH is a regular octagon. $\overrightarrow{AB}$ is represented by the vector $\mathbf{a}$, and $\overrightarrow{BC}$ by the vector $\mathbf{b}$.

a. By means of a diagram, or otherwise, explain why $\overrightarrow{CD} = \sqrt{2}\mathbf{b} - \mathbf{a}$.

b. By means of a diagram, or otherwise, explain why $\overrightarrow{DE} = \mathbf{b} - \sqrt{2}\mathbf{a}$.

c. Express the following vectors in terms of $\mathbf{a}$ and $\mathbf{b}$.

- $\overrightarrow{EF}$
- $\overrightarrow{FG}$
- $\overrightarrow{GH}$
- $\overrightarrow{HA}$
- $\overrightarrow{HC}$
- $\overrightarrow{AD}$
- $\overrightarrow{BE}$
- $\overrightarrow{BF}$

In the quadrilateral $OABC$, $M$, $N$, $P$ and $Q$ are the midpoints of the sides as shown. $\overrightarrow{OA}$ is represented by the vector $\mathbf{a}$, and $\overrightarrow{OC}$ by the vector $\mathbf{c}$. The diagonal $\overrightarrow{OB}$ is represented by the vector $\mathbf{b}$.

a. Express these vectors in terms of $\mathbf{a}$, $\mathbf{b}$ and $\mathbf{c}$.

- $\overrightarrow{AB}$
- $\overrightarrow{AP}$
- $\overrightarrow{OP}$

Give your answers as simply as possible.

b. i. Express the vector $\overrightarrow{ON}$ in terms of $\mathbf{b}$ and $\mathbf{c}$.

ii. Hence express the vector $\overrightarrow{PN}$ in terms of $\mathbf{a}$ and $\mathbf{c}$.

c. i. Express the vector $\overrightarrow{QM}$ in terms of $\mathbf{a}$ and $\mathbf{c}$.

ii. What relationship is there between $\overrightarrow{PN}$ and $\overrightarrow{QM}$?

iii. What sort of quadrilateral is $PNMQ$?

d. Prove that $\overrightarrow{AC} = 2\overrightarrow{QM}$.

L, M, N, P, Q, R are the midpoints of the line segments, as shown. $\overrightarrow{OA} = \mathbf{a}$, $\overrightarrow{OB} = \mathbf{b}$, $\overrightarrow{OC} = \mathbf{c}$.

a. Express these vectors in terms of $\mathbf{a}$ and $\mathbf{c}$.

- $\overrightarrow{OL}$
- $\overrightarrow{AC}$
- $\overrightarrow{OQ}$
- $\overrightarrow{LQ}$

b. Express these vectors in terms of $\mathbf{a}$ and $\mathbf{b}$.

- $\overrightarrow{LM}$
- $\overrightarrow{QP}$

c. Prove that the quadrilateral LMPQ is a parallelogram.

d. Find two other sets of four points that form parallelograms.
In triangle ABC, M is the mid-point of BC.
\[ \overrightarrow{AB} = \mathbf{a} \quad \text{and} \quad \overrightarrow{AC} = \mathbf{b} \]

Find \[ \overrightarrow{AM} \] in terms of \( \mathbf{a} \) and \( \mathbf{b} \).
Give your answer in its simplest form.

The diagram shows two vectors \( \mathbf{a} \) and \( \mathbf{b} \).

On a copy of the grid, draw the vector \( 2\mathbf{a} - \mathbf{b} \).

\[ \text{OAB is a triangle with } \text{X the mid-point of OA and Y the mid-point of AB.} \]
\[ \overrightarrow{OA} = \mathbf{a} \quad \text{and} \quad \overrightarrow{OB} = \mathbf{b} \]

a Find, in terms of \( \mathbf{a} \) and \( \mathbf{b} \)
   \[ i \quad \overrightarrow{AX} \]
   \[ ii \quad \overrightarrow{OY} \]

b What type of quadrilateral is \( \text{OXYB} \)?
Give a reason for your answer.

Edexcel, Question 19, Paper 5 Higher, November 2003

\[ \text{OPQ is a triangle, } T \text{ is the point on PQ for which } PT : TQ = 2 : 1 \]
\[ \overrightarrow{OP} = \mathbf{a} \quad \text{and} \quad \overrightarrow{OQ} = \mathbf{b} \]

a Write down, in terms of \( \mathbf{a} \) and \( \mathbf{b} \), an expression for \( \overrightarrow{PQ} \).

b Express \( \overrightarrow{OT} \) in terms of \( \mathbf{a} \) and \( \mathbf{b} \). Give your answer in its simplest form.

Edexcel, Question 21, Paper 5 Higher, November 2003

The diagram shows a regular hexagon \( \text{ABCDEFG} \) with centre \( \text{O} \).
\[ \overrightarrow{OA} = 6\mathbf{a} \quad \text{and} \quad \overrightarrow{OB} = 6\mathbf{b} \]

a Express in terms of \( \mathbf{a} \) and/or \( \mathbf{b} \)
   \[ i \quad \overrightarrow{AB} \]
   \[ ii \quad \overrightarrow{EF} \]

b What is the midpoint of \( \text{BC} \).

\[ \text{X is the midpoint of BC.} \]

b Express \( \overrightarrow{EX} \) in terms of \( \mathbf{a} \) and/or \( \mathbf{b} \)

\[ \text{Y is the point on AB extended, such that } AB : BY = 3 : 2 \]

Prove that \( E, X \) and \( Y \) lie on the same straight line.

Edexcel, Question 23, Paper 5 Higher, June 2003
In the triangle OAB, P is the midpoint of AB, X is the midpoint of OB, OX = a and OC = b. Q is the point that divides OP in the ratio 2 : 1.

\[ \vec{AB} = \vec{BA} + \vec{AO} + \vec{OC} = -2\vec{a} + 6\vec{b} = 4\vec{b} - \vec{a} \]

\[ \vec{OQ} = \vec{OC} + \vec{CQ} = \vec{OC} - \frac{1}{2}\vec{BC} = 6\vec{b} - \frac{1}{2}(4\vec{b} - \vec{a}) = 6\vec{b} - 2\vec{b} + \frac{1}{2}\vec{a} = \frac{3}{2}\vec{a} + 4\vec{b} \]

\[ \vec{PQ} = \vec{PB} + \vec{BQ} = \vec{PB} + \frac{1}{2}\vec{BC} = \vec{b} + 2\vec{b} - \frac{1}{2}\vec{a} = 3\vec{b} - \frac{1}{2}\vec{a} \]

b) Deduce that A\vec{X} = kA\vec{O}, where k is a scalar, and find the value of k.

\[ \vec{AX} = \vec{AQ} \]

\[ \vec{AX} = \vec{AQ} \quad \text{where} \quad k = \frac{1}{3} \]

WORKED EXAM QUESTION

\[ \text{OABC is a trapezium with AB parallel to OC.} \]
\[ \text{P, Q and R are the mid-points of AB, BC and OC respectively.} \]
\[ \text{OC is three times the length of AB.} \]
\[ \vec{OA} = \vec{a} \text{ and } \vec{AP} = \vec{b} \]

a) Express, in terms of \( \vec{a} \) and \( \vec{b} \), the following vectors.

i) \( \vec{BC} \)

ii) \( \vec{OQ} \)

iii) \( \vec{PQ} \)

b) \( \vec{S} \) is the mid-point of \( \vec{PR} \).

Prove that \( \vec{SQ} \) is parallel to \( \vec{OC} \).

Solution

a) i) \( \vec{BC} = \vec{BA} + \vec{AO} + \vec{OC} = -2\vec{a} + 6\vec{b} = 4\vec{b} - \vec{a} \)

ii) \( \vec{OQ} = \vec{OC} + \vec{CQ} = \vec{OC} - \frac{1}{2}\vec{BC} = 6\vec{b} - \frac{1}{2}(4\vec{b} - \vec{a}) = 6\vec{b} - 2\vec{b} + \frac{1}{2}\vec{a} = \frac{3}{2}\vec{a} + 4\vec{b} \)

iii) \( \vec{PQ} = \vec{PB} + \vec{BQ} = \vec{PB} + \frac{1}{2}\vec{BC} = \vec{b} + 2\vec{b} - \frac{1}{2}\vec{a} = 3\vec{b} - \frac{1}{2}\vec{a} \)

b) \( \vec{FR} = \vec{FX} + \vec{OX} + \vec{OR} = -\vec{a} + 3\vec{b} = 2\vec{b} - \vec{a} \)

So \( \vec{F} = \frac{1}{2}\vec{R} = \vec{b} - \frac{1}{2}\vec{a} \)

\( \vec{SQ} = \vec{SF} + \vec{FP} = \frac{1}{2}\vec{a} - \vec{b} + 3\vec{b} - \frac{1}{2}\vec{a} = 2\vec{b} \)

\( \vec{OC} = 6\vec{b} \), so \( \vec{SQ} \) is parallel to \( \vec{OC} \)
GRADE YOURSELF

- Able to solve problems using addition and subtraction of vectors
- Able to solve more complex geometrical problems

What you should know now

- How to add and subtract vectors
- How to apply vector methods to solve geometrical problems
This chapter will show you ...

- how to transform a graph
- how to recognise the relationships between graphs and their equations

**Visual overview**

```
Transformation of a graph
  Translation
    In the y-direction
    In the x-direction
  Stretch
    In the y-direction
    In the x-direction
  Reflection
    In the x-axis
    In the y-axis
```

**What you should already know**

- How to transform a shape by a translation and a reflection
- A translation is described by a column vector
- A reflection is described by a mirror line

continued
CHAPTER 26: TRANSFORMATION OF GRAPHS

- The graphs of \( y = x^2, \ y = x^3, \ y = \frac{1}{x}, \ y = \sin x, \ y = \cos x \) and \( y = \tan x \)

Quick check

Starting with the shaded triangle every time, do the following transformations.

\[ \begin{align*}
\text{a translation} & \\
\text{i} & \begin{bmatrix} 3 \\ 0 \end{bmatrix} \\
\text{ii} & \begin{bmatrix} 0 \\ -2 \end{bmatrix}
\end{align*} \]

\[ \begin{align*}
\text{b reflection in the} & \\
\text{i} & y\text{-axis} \\
\text{ii} & x\text{-axis}
\end{align*} \]

\[ \begin{align*}
\text{c rotation of 180°} & \text{ about the origin}
\end{align*} \]
We use the notation \( f(x) \) to represent a function of \( x \). A function of \( x \) is any algebraic expression in which \( x \) is the only variable. Examples of functions are: \( f(x) = x + 3 \), \( f(x) = 5x \), \( f(x) = 2x - 7 \), \( f(x) = x^2 \), \( f(x) = x^3 + 2x - 1 \), \( f(x) = \sin x \) and \( f(x) = \frac{1}{x} \).

Below and on page 582 are six general statements or rules about transforming graphs.

This work is much easier to understand if you have access to a graphics calculator or a graph-drawing computer program.

The graph on the right represents any function \( y = f(x) \).

**Rule 1** The graph of \( y = f(x) + a \) is a translation of the graph of \( y = f(x) \) by a vector \( \begin{pmatrix} 0 \\ a \end{pmatrix} \).

**Rule 2** The graph of \( y = f(x - a) \) is a translation of the graph of \( y = f(x) \) by a vector \( \begin{pmatrix} a \\ 0 \end{pmatrix} \).
A stretch is an enlargement that takes place in one direction only. It is described by a scale factor and the direction of the stretch.

**Rule 3** The graph of \( y = kf(x) \) is a stretch of the graph \( y = f(x) \) by a scale factor of \( k \) in the \( y \)-direction.

**Rule 4** The graph of \( y = f(tx) \) is a stretch of the graph \( y = f(x) \) by a scale factor of \( \frac{1}{t} \) in the \( x \)-direction.

**Rule 5** The graph of \( y = -f(x) \) is the reflection of the graph \( y = f(x) \) in the \( x \)-axis.

**Rule 6** The graph of \( y = f(-x) \) is the reflection of the graph \( y = f(x) \) in the \( y \)-axis.
Note that two of the transformations cause problems because they seem to do the opposite of what is expected. These are:

\[ y = f(x + a) \]  
(Rule 2)

The translation is \((-a, 0)\), so the sign of the constant inside the bracket changes in the vector (see part e in Example 1).

\[ y = f(ax) \]  
(Rule 4)

This is not a stretch. It actually closes the graph up. Just like an enlargement (see Chapter 8) can make something smaller, a stretch can make it squeeze closer to the axes.
1. On the same axes sketch the following graphs.
   a) \( y = x^2 \)  
   b) \( y = 3x^2 \)  
   c) \( y = \frac{1}{2}x^2 \)  
   d) \( y = 10x^2 \)  
   e) Describe the transformation(s) that take(s) the graph in part a to each of the graphs in parts b to d.

2. On the same axes sketch the following graphs.
   a) \( y = x^2 \)  
   b) \( y = x^3 + 3 \)  
   c) \( y = x^3 - 1 \)  
   d) \( y = 2x^3 + 1 \)
   e) Describe the transformation(s) that take(s) the graph in part a to each of the graphs in parts b to d.

3. On the same axes sketch the following graphs.
   a) \( y = x^2 \)  
   b) \( y = (x + 3)^2 \)  
   c) \( y = (x - 1)^2 \)  
   d) \( y = 2(x - 2)^2 \)
   e) Describe the transformation(s) that take(s) the graph in part a to each of the graphs in parts b to d.

4. On the same axes sketch the following graphs.
   a) \( y = x^2 \)  
   b) \( y = (x + 3)^2 - 1 \)  
   c) \( y = 4(x - 1)^2 + 3 \)
   d) Describe the transformation(s) that take(s) the graph in part a to each of the graphs in parts b and c.

5. On the same axes sketch the following graphs.
   a) \( y = x^2 \)  
   b) \( y = -x^2 + 3 \)  
   c) \( y = -3x^2 \)  
   d) \( y = -2x^2 + 1 \)
   e) Describe the transformation(s) that take(s) the graph in part a to each of the graphs in parts b to d.

6. On the same axes sketch the following graphs.
   a) \( y = \sin x \)  
   b) \( y = 2\sin x \)  
   c) \( y = \frac{1}{2}\sin x \)  
   d) \( y = 10\sin x \)
   e) Describe the transformation(s) that take(s) the graph in part a to each of the graphs in parts b to d.

7. On the same axes sketch the following graphs.
   a) \( y = \sin x \)  
   b) \( y = \sin 3x \)  
   c) \( y = \sin \frac{x}{2} \)  
   d) \( y = 5\sin 2x \)
   e) Describe the transformation(s) that take(s) the graph in part a to each of the graphs in parts b to d.

8. On the same axes sketch the following graphs.
   a) \( y = \sin x \)  
   b) \( y = \sin (x + 90^\circ) \)  
   c) \( y = \sin (x - 45^\circ) \)  
   d) \( y = 2\sin (x - 90^\circ) \)
   e) Describe the transformation(s) that take(s) the graph in part a to the graphs in parts b to d.

3. On the same axes sketch the following graphs.
   a) \( y = \sin x \)
   b) \( y = \sin x + 2 \)
   c) \( y = \sin x - 3 \)
   d) \( y = 2 \sin x + 1 \)

   e) Describe the transformation(s) that take(s) the graph in part a to each of the graphs in parts b to d.

4. On the same axes sketch the following graphs.
   a) \( y = \sin x \)
   b) \( y = -\sin x \)
   c) \( y = \sin (-x) \)
   d) \( y = -\sin (-x) \)

   e) Describe the transformation(s) that take(s) the graph in part a to each of the graphs in parts b to d.

5. On the same axes sketch the following graphs.
   a) \( y = \cos x \)
   b) \( y = 2 \cos x \)
   c) \( y = \cos (x - 60^\circ) \)
   d) \( y = \cos x + 2 \)

   e) Describe the transformation(s) that take(s) the graph in part a to each of the graphs in parts b to d.

6. Describe the transformations of the graph of \( y = x^2 \) needed to obtain these graphs.
   a) \( y = 4x^2 \)
   b) \( y = 9x^2 \)
   c) \( y = 16x^2 \)

   b) Describe the transformations of the graph of \( y = x^2 \) needed to obtain these graphs.
   i) \( y = (2x)^2 \)
   ii) \( y = (3x)^2 \)
   iii) \( y = (4x)^2 \)

   c) Describe two different transformations that take the graph of \( y = x^2 \) to the graph of \( y = (ax)^2 \), where \( a \) is a positive number.

7. On the right is a sketch of the function \( y = f(x) \). Use this to sketch the following.
   a) \( y = f(x) + 2 \)
   b) \( y = 2f(x) \)
   c) \( y = f(x - 3) \)
   d) \( y = -f(x) \)
   e) \( y = 2f(x) + 3 \)
   f) \( y = -f(x) - 2 \)

8. What is the equation of the graph obtained when the following transformations are performed on the graph of \( y = x^2 \)?
   a) stretch by a factor of 5 in the y-direction
   b) translation of \( (0, 7) \)
   c) translation of \( (-3, 0) \)
   d) translation of \( (-2, -3) \)
   e) stretch by a factor of 3 in the y-direction followed by a translation of \( (0, 4) \)
   f) reflection in the x-axis, followed by a stretch, scale factor 3, in the y-direction
What is the equation of the graph obtained when the following transformations are performed on the graph of \( y = \cos x \)?

a. stretch by a factor of 6 in the \( y \)-direction

b. translation of \( \left( \frac{0}{3} \right) \)

c. translation of \( \left( \frac{-30}{0} \right) \)

d. translation of \( \left( \frac{45}{-2} \right) \)

e. stretch by a factor of 3 in the \( y \)-direction followed by a translation of \( \left( \frac{0}{-2} \right) \)

Sketch the graph \( y = x^3 \).

Use your sketch in part a to draw the graphs obtained after \( y = x^3 \) is transformed as follows.

i. reflection in the \( x \)-axis

ii. translation of \( \left( \frac{0}{-2} \right) \)

iii. stretch by a scale factor of 3 in the \( y \)-direction

iv. translation of \( \left( \frac{-2}{0} \right) \)

Give the equation of each of the graphs obtained in part b.

Sketch the graph of \( y = \frac{1}{x} \).

Use your sketch in part a to draw the graphs obtained after \( y = \frac{1}{x} \) is transformed as follows.

i. translation of \( \left( \frac{0}{4} \right) \)

ii. translation of \( \left( \frac{4}{0} \right) \)

iii. stretch, scale factor 3 in the \( y \)-direction

iv. stretch, scale factor \( \frac{1}{2} \) in the \( x \)-direction

Give the equation of each of the graphs obtained in part b.

The graphs below are all transformations of \( y = x^2 \). Two points through which each graph passes are indicated. Use this information to work out the equation of each graph.
The graphs below are all transformations of \( y = \sin x \). Two points through which each graph passes are indicated. Use this information to work out the equation of each graph.

Below are the graphs of \( y = \sin x \) and \( y = \cos x \).

a Describe a series of transformations that would take the first graph to the second.

b Which of these is equivalent to \( y = \cos x \)?

i \( y = \sin (x + 90^\circ) \)

ii \( y = -\sin (x - 90^\circ) \)

iii \( y = 2\cos \frac{x}{2} \)

Match each of the graphs A, B, C, D and E to one of these equations.

i \( y = x^2 \)

ii \( y = -x^2 + 3 \)

iii \( y = -(x - 2)^2 \)

iv \( y = (x + 2)^2 \)

v \( y = x^2 + 4 \)
A sketch of the graph \( y = x^2 \) is given below.

Write down the equations of the two transformed graphs below.

\[\begin{align*}
\text{a} & \quad y = x^2 - 1 \\
\text{b} & \quad y = x^2 + 1
\end{align*}\]

The graph of \( y = \sin x \) for \( 0 \leq x \leq 360 \) is drawn below.

On copies of the same axes draw sketches of the following graphs.

\[\begin{align*}
\text{a} & \quad y = 2 \sin x \\
\text{b} & \quad y = \sin 2x \\
\text{c} & \quad y = \sin x - 2
\end{align*}\]

The graph of \( y = f(x) \) is shown below.

On copies of the grid, sketch the following graphs:

\[\begin{align*}
\text{a} & \quad y = f(x + 1) \\
\text{b} & \quad y = 2f(x)
\end{align*}\]

This is a sketch of the curve with equation \( y = f(x) \). It passes through the origin O.

The only vertex of the curve is at (2, -4).

\[\begin{align*}
\text{a} & \quad \text{Write down the coordinates of the vertex of the curve with equation} \\
& \quad \text{i} \quad y = f(x - 3), \\
& \quad \text{ii} \quad y = f(x) - 5, \\
& \quad \text{iii} \quad y = -f(x), \\
& \quad \text{iv} \quad y = f(2x).
\end{align*}\]

The curve with equation \( y = x^2 \) has been translated to give the curve \( y = f(x) \).

\[\begin{align*}
\text{b} & \quad \text{Find } f(x) \text{ in terms of } x.
\end{align*}\]
WORKED EXAM QUESTION

The sketch shows the graph \( y = x^3 \).

On the axes below sketch the graphs indicated. (The graph \( y = x^3 \) is shown dotted to help you.)

a. \( y = x^3 - 3 \)

b. \( y = (x + 2)^3 \)

c. \( y = -x^3 \)

Solution

a. This is a translation of \( y = x^3 \) by the vector \( \left( \begin{array}{c} 0 \\ -3 \end{array} \right) \).

b. This is a translation of \( y = x^3 \) by the vector \( \left( \begin{array}{c} -2 \\ 0 \end{array} \right) \).

c. This is a reflection of \( y = x^3 \) in the \( x \)-axis.

You do not know what the actual value of \( p \) is so make sure that the translation is clear. Alternatively, make a value for \( p \) up, say 2.
GRADE YOURSELF

Able to transform the graph of a given function
Able to identify the equation of a function from its graph, which has been formed by a transformation on a known function

What you should know now

● How to sketch the graphs of functions such as \( y = f(ax) \) and \( y = f(x + a) \) from the known graph of \( y = f(x) \)
● How to describe from their graphs the transformation of one function into another
● How to identify equations from the graphs of transformations of known graphs
This chapter will show you ...
- the meaning of “a counter-example”
- the difference between a numerical demonstration and a proof
- how to prove results using rigorous and logical mathematical arguments

Visual overview

What you should already know
The mathematical results in this book, such as:
- The interior angles in a triangle add up to 180°
- The sum of any two odd numbers is always an even number
- The theorems concerning circles
- Pythagoras’ theorem

Quick check
1. Give the value of the angle marked $z$ in terms of $x$ and $y$.

2. Write down a relationship between $p$, $q$ and $r$.

3. Complete this table.

<table>
<thead>
<tr>
<th></th>
<th>even</th>
<th>odd</th>
</tr>
</thead>
<tbody>
<tr>
<td>even</td>
<td>even</td>
<td></td>
</tr>
<tr>
<td>odd</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Can you prove any of the mathematical results listed on the previous page?

The method of mathematical proof is to proceed in logical steps, establishing a series of mathematical statements by using facts which are already known to be true. With few exceptions, a proof will also require the use of algebraic manipulation.

In the next pages, we prove four standard results: Pythagoras’ theorem, the sum of the interior angles of a triangle is 180°, the sum of any two odd numbers is always an even number, and congruency. Follow them through, making sure that you understand each step in the process.

**Proof of Pythagoras’ theorem**

Draw a square of side $c$ inside a square of side $(a + b)$, as shown.

The area of the exterior square is $(a + b)^2 = a^2 + 2ab + b^2$.

The area of each small triangle around the shaded square is $\frac{1}{2}ab$.

The total area of all four triangles is $4 \times \frac{1}{2}ab = 2ab$.

Subtracting the total area of the four triangles from the area of the large square gives the area of the shaded square:

$$a^2 + 2ab + b^2 - 2ab = a^2 + b^2$$

But the area of the shaded square is $c^2$, so

$$c^2 = a^2 + b^2$$

which is Pythagoras’ theorem.

**The sum of the interior angles of a triangle is 180°**

One of your earlier activities in geometry may have been to draw a triangle, to cut off its corners and to stick them down to show that they make a straight line.

Does this prove that the interior angles make 180° or were you just lucky and picked a triangle that worked? Was the fact that everyone else in the class managed to pick a triangle that worked also a lucky coincidence?

Of course not! But this was a demonstration, not a proof. You would have to show that this method worked for all possible triangles (there is an infinite number!) to say that you have proved this result.

Your proof must establish that the result is true for all triangles.

Look at the following proof.
Start with triangle ABC with angles $\alpha$, $\beta$ and $\gamma$ (figure i).

On figure i draw a line CD parallel to side AB and extend BC to E, to give figure ii.

Since AB is parallel to CD

$\angle ACD = \angle BAC = \alpha$ (alternate angles)

$\angle DCE = \angle ABC = \beta$ (corresponding angles)

BCE is a straight line, so $\gamma + \alpha + \beta = 180^\circ$. Therefore the interior angles of a triangle = $180^\circ$.

This proof assumes that alternate angles are equal and that corresponding angles are equal. Strictly speaking, we should prove these results, but we have to accept certain results as true. These are based on Euclid’s axioms from which all geometric proofs are derived.

**The sum of any two odd numbers is always an even number**

If you try this with numbers, you can see that the result is true. For example, $3 + 5 = 8$, $11 + 17 = 28$.

But this is not a proof. Once again, we may have been lucky and found some results that work. Until we have tried an infinite number of different pairs, we cannot be sure.

Look at the following algebraic proof.

Let $n$ be any whole number.

Whatever whole number is represented by $n$, $2n$ has to be even. So, $2n + 1$ represents any odd number.

Let one odd number be $2n + 1$, and let the other odd number be $2m + 1$.

The sum of these is

$$(2n + 1) + (2m + 1) = 2n + 2m + 1 + 1 = 2n + 2m + 2 = 2(n + m + 1),$$

which must be even.

**Congruency**

There are four conditions to prove congruency. These are commonly known as SSS (three sides the same), SAS (two sides and the included angle the same), ASA (or AAS) (two angles and one side the same) and RHS (right-angled triangle, hypotenuse, and one short side the same). **Note**: AAA (three angles the same) is not a condition for congruency.

When you prove a result, you must explain or justify every statement or line. Proofs have to be rigorous and logical.

**EXAMPLE 1**

$ABCD$ is a parallelogram. X is the point where the diagonals meet.

Prove that triangles $AXB$ and $CXD$ are congruent.

$\angle BAX = \angle DCX$ (alternate angles)

$\angle ABX = \angle CDX$ (alternate angles)

$AB = CD$ (opposite sides in a parallelogram)

Hence $\triangle AXB$ is congruent to $\triangle CXD$ (ASA).

Note that you could have used $\angle AXB = \angle CDX$ (vertically opposite angles) as the second line but whichever approach is used you must give a reason for each statement.
CHAPTER 27: PROOF

In some questions, a numerical example is used to give you a clue which will help you to write down an algebraic proof.

1. a Choose any odd number and any even number. Add these together. Is the result odd or even? Does this always work for any odd number and even number you choose?
   b Let any odd number be represented by \(2n + 1\). Let any even number be represented by \(2m\), where \(m\) and \(n\) are integers. Prove that the sum of an odd number and an even number always gives an odd number.

2. Prove the following results.
   a the sum of two even numbers is even
   b the product of two even numbers is even
   c the product of an odd number and an even number is even
   d the product of two odd numbers is odd
   e the sum of four consecutive numbers is always even
   f half the sum of four consecutive numbers is always odd

3. a Show that the triangle ABC (figure i) is isosceles.
   b Prove that the triangle DEF (figure ii) with one angle of \(x^\circ\) and an exterior angle of \(90^\circ + \frac{x^\circ}{2}\) is isosceles.

4. Prove that a triangle with an interior angle of \(\frac{x^\circ}{2}\) and an exterior angle of \(x^\circ\) is isosceles.

5. a Using the theorem that the angle subtended by an arc at the centre of a circle is twice the angle subtended by the same arc at the circumference, find the values of angles DAB and ACB in the circle shown in figure i.
   b Prove that the sum of the opposite angles of a cyclic quadrilateral is \(180^\circ\). (You may find figure ii useful.)

6. A Fibonacci sequence is formed by adding the previous two terms to get the next term. For example, if we start with 3 and 4, the series is
   \[3, 4, 7, 11, 18, 29, 47, 76, 123, 199, \ldots\]
   a Continue the Fibonacci sequence up to 10 terms. 1, 1, 2, ...
   b Continue the Fibonacci sequence up to 10 terms. \(a, a + b, a + 2b, 2a + 3b, \ldots\)
   c Prove that the difference between the 8th term and the 5th term of any Fibonacci sequence is twice the sixth term.

7. The \(n\)th term in the sequence of triangular numbers 1, 3, 6, 10, 15, 21, 28, \ldots is given by \(\frac{1}{2}n(n + 1)\).
Show that the sum of the 11th and 12th terms is a perfect square.

Explain why the \((n + 1)\)th term of the triangular number sequence is given by \(\frac{1}{2}(n + 1)(n + 2)\).

Prove that the sum of any two consecutive triangular numbers is always a square number.

The triangle ABC is isosceles. BCD and AED are straight lines. Find the value of the angle CED, marked \(x\), in figure i.

Prove that angle ACB = angle CED in figure ii.

The diagram shows part of a 10 \(\times\) 10 “hundred square”.

One 2 \(\times\) 2 square is marked.

i Work out the difference between the product of the bottom-left and top-right values and the product of the top-left and bottom-right values:

\[22 \times 13 - 12 \times 23\]

ii Repeat this for any other 2 \(\times\) 2 square of your choosing.

Prove that this will always give an answer of 10 for any 2 \(\times\) 2 square chosen.

The diagram shows a calendar square (where the numbers are arranged in rows of seven). Prove that you always get a value of 7 if you repeat the procedure in part a i.

Prove that in a number square that is arranged in rows of \(n\) numbers then the difference is always \(n\) if you repeat the procedure in part a i.

Prove that if you add any two-digit number from the 9 times table to the reverse of itself (that is, swap the tens digit and units digit), the result will always be 99.

### 27.2 Algebraic proof

In this section you will learn how to:

- give a rigorous and logical algebraic proof

**Key words**

- area
- length
- width

There are three levels of “proof”: Verify that..., Show that..., and Prove that...

- At the lowest level (verification), all you have to do is to substitute numbers into the result to show that it works.
- At the middle level, you have to show that both sides of the result are the same algebraically.
- At the highest level (proof), you have to manipulate the left-hand side of the result to become its right-hand side.

The following example demonstrates these three different procedures.

CHAPTER 27: PROOF

590

1. Speed Cabs charges 45 pence per kilometre for each journey. Evans Taxis has a fixed charge of 90p plus 30p per kilometre.
   a i Verify that Speed Cabs is cheaper for a journey of 5 km.
   ii Verify that Evans Taxis is cheaper for a journey of 7 km.
   b Show clearly why both companies charge the same for a journey of 6 km.
   c Show that if Speed Cabs charges \( a \) pence per kilometre, and Evans Taxis has a fixed charge of £\( b \) plus a charge of \( c \) pence per kilometre, both companies charge the same for a journey of \( \frac{100b}{a-c} \) kilometres.

2. You are given that:
   \((a + b)^2 + (a - b)^2 = 2(a^2 + b^2)\)
   a Verify that this result is true for \( a = 3 \) and \( b = 4 \).
   b Show that the LHS is the same as the RHS.
   c Prove that the LHS can be simplified to the RHS.

3. Prove that \((a + b)^2 - (a - b)^2 = 4ab\).
The rule for converting from degrees Fahrenheit to degrees Celsius is to subtract 32° and then to multiply by \(\frac{5}{9}\).

Prove that the temperature that has the same value in both scales is \(-40°\).

The sum of the series \(1 + 2 + 3 + 4 + \ldots + (n - 2) + (n - 1) + n\) is given by \(\frac{1}{2}n(n + 1)\).

- **a** Verify that this result is true for \(n = 6\).
- **b** Write down a simplified value, in terms of \(n\), for the sum of these two series.

\[
1 + 2 + 3 + \ldots + (n - 2) + (n - 1) + n
\]

and

\[
 n + (n - 1) + (n - 2) + \ldots + 3 + 2 + 1
\]

- **c** Prove that the sum of the first \(n\) integers is \(\frac{1}{2}n(n + 1)\).

The following is a “think of a number” trick.

- Think of a number.
- Add 10.
- Subtract the original number.

The result is always 5.

- **a** Verify that the trick works when you pick 7 as the original number.
- **b** Prove why the trick always works.

You are told that “when two numbers have a difference of 2, the difference of their squares is twice the sum of the two numbers”.

- **a** Verify that this is true for 5 and 7.
- **b** Prove that the result is true.
- **c** Prove that when two numbers have a difference of \(n\), the difference of their squares is \(n\) times the sum of the two numbers.

Four consecutive numbers are 4, 5, 6 and 7.

- **a** Verify that their product plus 1 is a perfect square.
- **b** Complete the multiplication square and use it to show that

\[
(n^2 - n - 1)^2 = n^4 - 2n^3 - n^2 + 2n + 1
\]

- **c** Let four consecutive numbers be \((n - 2), (n - 1), n, (n + 1)\). Prove that the product of four consecutive numbers plus 1 is a perfect square.

Here is another mathematical trick to try on a friend.

- Think of two single-digit numbers.
- Multiply one number (your choice) by 2.
- Add 5 to this answer.
- Multiply this answer by 5.
- Add the second number.
- Subtract 4.
- Ask your friend to state his or her final answer.
- Mentally subtract 21 from his or her answer.

The two digits you get are the two digits your friend first thought of.

Prove why this works.
You may not be able algebraically to prove all of these results. Some of them can be disproved by a counter-example. You should first try to verify each result, then attempt to prove it – or at least try to demonstrate that the result is probably true by trying lots of examples.

1. \( T \) represents any triangular number. Prove the following.
   a. \( 8T + 1 \) is always a square number
   b. \( 9T + 1 \) is always another triangular number

2. Lewis Carroll, who wrote *Alice in Wonderland*, was also a mathematician. In 1890, he suggested the following results.
   a. For any pair of numbers, \( x \) and \( y \), if \( x^2 + y^2 \) is even, then \( \frac{1}{2}(x^2 + y^2) \) is the sum of two squares.
   b. For any pair of numbers, \( x \) and \( y \), \( 2(x^2 + y^2) \) is always the sum of two squares.
   c. Any number whose square is the sum of two squares is itself the sum of two squares.
   Can you prove these statements to be true or false?

3. For all values of \( n \), \( n^2 - n + 41 \) gives a prime number. True or false?

4. For any integer \( n \), \( 2n, n^2 - 1 \) and \( n^2 + 1 \) form three numbers that obey Pythagoras' theorem. Can you prove this?

5. Waring's theorem states that: “Any whole number can be written as the sum of not more than four square numbers.”
   For example, \( 27 = 3^2 + 3^2 + 3^2 \) and \( 23 = 3^2 + 3^2 + 2^2 + 1^2 \).
   Is this always true?

6. Take a three-digit multiple of 37, for example, \( 7 \times 37 = 259 \). Write these digits in a cycle.
   Take all possible three-digit numbers from the cycle, for example, \( 259, 592 \) and \( 925 \).
   Divide each of these numbers by 37 to find that
   \[ 259 = 7 \times 37 \quad 592 = 16 \times 37 \quad 925 = 25 \times 37. \]
   Is this true for all three-digit multiples of 37?
   Is it true for a five-digit multiple of 41?

7. Prove that the sum of the squares of two consecutive integers is an odd number.

8. PQRS is a parallelogram. Prove that triangles PQS and RQS are congruent.

9. OB is a radius of a circle, centre O. C is the point where the perpendicular bisector of OB meets the circumference. Prove that triangle OBC is equilateral.

10. In the following grid, \( \overrightarrow{OA} = \mathbf{a} \) and \( \overrightarrow{OB} = \mathbf{b} \).
    Prove that AB is parallel to EF.
**EXAM QUESTIONS**

T, A and B are points on the circumference of the circle, centre O.
AT is a diameter of the circle.
Angle BTC = 40°
Angle TAB = 30°
Explain why TC cannot be a tangent to the circle.

*S and T are points on a circle, centre O. PSQ and PTR are tangents to the circle. SOR and TOQ are straight lines.*

**WORKED EXAM QUESTION**

*n is a positive integer.*

*i* Explain why \(n(n + 1)\) must be an even number.

*ii* Explain why \(2n + 1\) must be an odd number.

*b* Expand and simplify \((2n + 1)^2\)

*c* Prove that the square of any odd number is always 1 more than a multiple of 8.

**Solution**

*a* i If \(n\) is odd, \(n + 1\) is even

If \(n\) is even, \(n + 1\) is odd

Even times odd is always even

ii \(2n\) must be even so \(2n + 1\) must be odd

*b* \((2n + 1)^2 = (2n + 1)(2n + 1) = 4n^2 + 2n + 2n + 1 = 4n^2 + 4n + 1\)

*c* \((2n + 1)^2 = 4n^2 + 4n + 1\)

\(4n^2 + 4n + 1 = 4n(n + 1) + 1\)

\(4 \times n(n + 1) + 1 = 4 \times \text{even} + 1\),

which must be a multiple of 8 plus 1.
GRADE YOURSELF

Able to verify results by substituting numbers into them
Able to understand the proofs of simple theorems such as an exterior angle of a triangle is the sum of the two opposite interior angles
Able to show that an algebraic statement is true, using both sides of the statement to justify your answer
Able to prove algebraic and geometric results with rigorous and logical mathematical arguments

What you should know now

- The meaning of the terms “verify that”, “show that” and “prove”
- How to prove some standard results in mathematics, such as Pythagoras’ theorem
- How to use your knowledge of proof to answer the questions throughout the book that are flagged with the proof icon
**Really Useful Maths!**

### Chapter 11

**Really Useful Maths:** Dairy farm

- 3-month moving average for milk production in thousands of litres:
  - Year: 2004
  - World population: 6,712 litres per person per day
  - World oil production, barrels per day: 4.7 x 10¹⁰
  - World oil production, barrels per person per day: 0.75

Comments on line graphs: Each year, January has the lowest production. It rises steadily towards July, then decreases again towards the following January. 2005 production is about 10,000 litres more per month than 2004.

### Chapter 12

**Really Useful Maths:** Garden design

- Perimeter of patio: 56.55 m
- Area of patio: 254.47 m²
- Perimeter of play area: 45.13 m
- Area of play area: 130.27 m²
- Perimeter of flower bed: 13.83 m
- Area of flower bed: 7.5 m²
- Dimensions of top pond length: 4 m
- Area of top pond: 8 m²
- Perimeter of one flower bed: 13.83 m
- Area of one flower bed: 7.5 m²
- Perimeter of play area: 45.13 m
- Area of play area: 130.27 m²
- Perimeter of patio: 56.55 m
- Area of patio: 254.47 m²

### Chapter 14

**Really Useful Maths:** Bright ideas

- Volume of stem: 154.9 cm³
- Weight of stem: 1649 g
- Volume of base: 88.3 cm³
- Weight of base: 883 g
- Total weight: 2532 g

The mean weight per lamb has increased from 36 kg to 44 kg. This is an increase of 22%. However, the price per kg of lamb has fallen from £3.85 to £2.73, a decrease of 25%.

The only two weeks when the condition of the lambs fell below 42% were 3rd June and 17th June.

Comment: There were only 3 weeks when Mrs Woolman earned less than the average lamb price. The trend of both Mrs Woolman’s prices and the average prices were decreasing from April to June.
Chapter 18
Really Useful Maths: Are we living longer?

Age distribution in the UK (numbers in millions)

</table>

The area of the lounge and kitchen/diner may be calculated in several ways. Other possible answers are:

Lounge: 61.07 m² and 61.13 m² (if this alternative answer is given, total maximum floor area for oak effect becomes 148.4775 m², the numbers of packs of flooring required is unaffected)

Similarly, the edging required for the Kitchen/Diner could be calculated as 27.35 m (if this alternative answer is given, total maximum edging needed for oak effect becomes 92.9 m, numbers of packs of edging is unaffected)

Number of packs | Price per pack | Total cost |

Exercise 6A
1 10.3 cm  2 5.9 cm
3 8.5 cm  4 20.8 cm
5 18.6 cm  6 17.5 cm
7 5 cm  8 13 cm
9 10 cm

Exercise 6B
1 a 15 cm  b 14.7 cm  c 6.3 cm  d 18.3 cm
2 a 20.8 m  b 15.5 cm  c 15.5 m  d 12.4 cm
3 a 5 m  b 6 m  c 3 m  d 50 cm

Exercise 6C
1 6.83 m  2 2.06 m
3 11.3 m  4 19.2 km
5 a 127 m  b 99.6 m  c 27.4 m
6 4.88 m  7 a 3.87 m  b 1.74 m
8 3.16 m  9 13 units
10 a 4.74 m  b 4.54 m
11 16.5 cm²  12 12.1 m
13 25² = 24² + 7²; therefore, right-angled
14 7.21 units

Exercise 6D
1 a 32.2 cm²  b 2.83 cm²  c 50.0 cm²
2 22.2 cm²
3 15.6 cm²
4 a

b The areas are 12 cm² and 13.6 cm² respectively, so triangle with 6 cm, 6 cm, 5 cm sides has the greater area
5 a 166.3 cm²

5 259.8 cm²
6 10 cm  7 9 cm  8 9.6 cm

Exercise 6E
1 a 14.4 cm  ii 13 cm  iii 9.4 cm  b 15.2 cm
2 No, 6.8 m is longest length
3 a 24 cm and 20.6 cm  b 15.0 cm
4 21.3 cm
5 a 8.49 m  b 9 m
6 a 11.3 cm  b 7 cm  c 8.06 cm
7 a 50.0 cm  b 54.8 cm  c 48.3 cm  d 27.0 cm

Exercise 6F
1 a 0.682  b 0.829  c 0.922  d 1  e 0.707
f 0.342  g 0.375  h 0
2 a 0.731  b 0.559  c 0.388  d 0  e 0.707
f 0.940  g 0.927  h 1
3 45°
4 a i 0.574  ii 0.574  b i 0.208  ii 0.208
   c i 0.391  ii 0.391  d Same
   e i sin 15° is the same as cos 75°
   ii cos 82° is the same as sin 8°
   iii sin x is the same as sin (90° – x)
5 a 0.933  b 1.48  c 2.38  d Infinite  e 1
f 0.364  g 0.404  h 0
6 a 0.956  b 0.899  c 2.16  d 0.999
e 0.819  f 0.577  g 0.469  h 0.996
7 Has values > 1
8 a 4.53  b 4.46  c 6  d 0
9 a 10.7  b 5.40  c Infinite  d 0
10 a 3.56  b 8.96  c 28.4  d 8.91
11 a 5.61  b 7.08  c 6  d 10
12 a 1.46  b 7.77  c 0.087  d 7.15
13 a 7.73  b 48.6  c 2.28  d 15.2
14 a 29.9  b 44.8  c 20.3  d 2.38
15 a

Exercise 6G
1 a 30°  b 51.7°  c 39.8°  d 61.3°
e 87.4°  f 45.0°
2 a 60°  b 50.2°  c 2.6°  d 45.0
   e 78.5°  f 45.6°
3 a 31.0°  b 20.8°  c 41.8°  d 46.4°

5 a 36.9°  b 48.2°  c 45.6°  d 33.6°
e 87.6°  f 67.4°
6 a 31.0°  b 37.9°  c 15.9°  d 60.9°
e 57.5°  f 50.2°
7 Error message, largest value 1, smallest value –1
8 a i 17.5°  ii 72.5°  iii 90°  b Yes

Exercise 6H
1 a 17.5°  b 22.0°  c 32.2°
2 a 5.29 cm  b 5.75 cm  c 13.2 cm
3 a 4.57 cm  b 6.86 cm  c 100 cm
4 a 5.12 cm  b 9.77 cm  c 11.7 cm  d 15.5 cm
5 a 47.2°  b 5.42 cm  c 13.7 cm  d 38.0°
6 a 6  b 15  c 30

Exercise 6I
1 a 51.3°  b 75.5°  c 51.3°
2 a 6.47 cm  b 32.6 cm  c 137 cm
3 a 7.32 cm  b 39.1 cm  c 135 cm

Exercise 6J
1 a 33.7° b 36.9° c 52.1°
2 a 5.09 cm b 30.4 cm c 1120 cm
3 a 8.24 cm b 62.0 cm c 72.8 cm
4 a 9.02 cm b 7.51 cm c 7.14 cm d 8.90 cm
5 a 13.7 cm b 48.4° c 7.03 cm d 41.2°
6 12, 12, 2

Exercise 6K
1 a 12.6 b 59.6 c 74.7 d 16.0 e 67.9 f 20.1
2 a 44.4° b 39.8° c 44.4° d 49.5°
3 a 67.4° b 11.3 c 134 d 28.1° e 39.7
4 b \sin \theta + \cos \theta = \frac{1}{\theta} + \frac{1}{\pi} = \tan \theta

Exercise 6L
1 a 65° 2 2.05-3.00 m
3 44° 4 6.82 m

Quick check
1 a 50°
2 b 140°
3 c = d = 65°

Exercise 7A
1 a = b = 70°, c = 50°, d = 80°, e = 55°, f = 70°,
\[ g = h = 57.5° \]

2

3 a a = 110°, b = 55° c = e = 105°, d = 75°
\[ f = 135°, g = 25° d = f = 94° \]
\[ e = f = I = 105°, k = 75° \]
\[ m = o = 49°, n = 131° \]
4 40°, 40°, 100°
5 a = b = 65°, c = d = 115°, e = f = 65°, g = 80°,
\[ h = 60°, i = 60°, j = 60°, k = 20° \]
6 a x = 25°, y = 15° b x = 7°, y = 31°
\[ c = x = 60°, y = 30° \]
7 a x = 50°, 60°, 70°, 120°, 110° – possibly trapezium
\[ b = x = 60°, 50°, 130°, 50°, 130° – parallelogram or \]
\[ \text{isosceles trapezium} \]
\[ c = x = 30°, 20°, 60°, 140°, 140° – possibly kite} \]
\[ d = x = 20°, 90°, 90°, 90° – square or rectangle \]

Exercise 7B
1 a 1440° b 2340° c 17640° d 7740°
2 a 30° b 162° c 140° d 174°
3 a 9 b 15 c 102 d 50
4 a 15 b 36 c 24 d 72
5 a 15 b 9 c 20 d 40
6 a 130° b 95° c 130°
7 a 50° b 40° c 59°
8 Hexagon
9 a Octagon b 89°
10 a i 71° ii 109° iii Equal
\[ \text{b If } S = \text{sum of the two opposite interior angles,} \]
\[ \text{then } S + I = 180 \text{ (angles in a triangle)}, \text{and we know } E \]
\[ + I = 180 \text{ (angles on a straight line)}, \text{so } S + I = E + I, \text{therefore } S = E \]

Exercise 7C
1 a 56° b 62° c 105° d 55° e 45°
\[ f = 30° g = 60° h = 145° \]
2 a 55° b 52° c 50° d 24° e 39°
\[ f = 80° g = 34° h = 30° \]
3 a 41° b 49° c 41°
4 a 72° b 37° c 72°
5 a x = y = 40° b x = 131°, y = 111°
\[ c = x = 134°, y = 23° d = x = 32°, y = 19° \]
\[ e = x = 59°, y = 121° f = x = 155°, y = 12.5° \]
6 68°
7 a x b 2x
\[ c = \angle ABC = (x + y) \text{ and } \angle AOC = 2(x + y) \]
Exercise 7D
1 a $a = 50^\circ, b = 95^\circ$ b $c = 92^\circ, x = 90^\circ$
c $d = 110^\circ, e = 110^\circ, f = 70^\circ$
d $g = 105^\circ, h = 99^\circ$ e $j = 89^\circ, k = 89^\circ, l = 91^\circ$
f $m = 120^\circ, n = 40^\circ$ g $p = 44^\circ, q = 68^\circ$
h $x = 40^\circ, y = 64^\circ$
2 a $x = 26^\circ, y = 128^\circ$ b $x = 48^\circ, y = 78^\circ$
c $x = 133^\circ, y = 47^\circ$ d $x = 36^\circ, y = 72^\circ$
e $x = 55^\circ, y = 125^\circ$ f $x = 35^\circ$
g $x = 48^\circ, y = 45^\circ$ h $x = 66^\circ, y = 52^\circ$
i $x = 49^\circ, y = 49^\circ$ j $x = 70^\circ, y = 20^\circ$
j $x = 80^\circ, y = 100^\circ$ k $x = 100^\circ, y = 75^\circ$
l $x = 50^\circ, y = 62^\circ$ m $x = 92^\circ, y = 88^\circ$
n $x = 93^\circ, y = 42^\circ$ o $x = 55^\circ, y = 75^\circ$
p $x = 95^\circ, y = 138^\circ$ q $x = 14^\circ, y = 62^\circ$
r $x = 32^\circ, y = 48^\circ$ s $x = 52^\circ$
6 a $71^\circ$ b $125.5^\circ$ c $54.5^\circ$
7 a $x = 360^\circ - 2x$
b $\angle ADC = \frac{1}{2} \text{ reflex } \angle AOC = 180^\circ - x,$
c $\angle ADC + \angle ABC = 180^\circ$

Exercise 7E
1 a $38^\circ$ b $110^\circ$ c $15^\circ$ d $45^\circ$

Exercise 8A
1 a Yes, SAS b Yes, SSS c No d No e Yes, ASA f Yes, RHS g Yes, SSS h Yes, ASA
2 a Yes, SSS. A to R, B to P, C to Q b No c Yes, SAS. A to R, B to Q, C to P d No
3 i $60^\circ$ ii $80^\circ$ iii $90^\circ$ iv $5$ cm
4 i $110^\circ$ ii $55^\circ$ iii $85^\circ$ iv $110^\circ$ v $4$ cm
5 SSS or RHS
6 SSS or SAS or RHS

Exercise 8B
1 a i $\left(\frac{3}{2}\right)$ ii $\left(\frac{4}{2}\right)$ iii $\left(\frac{2}{2}\right)$ iv $\left(\frac{5}{2}\right)$
v $\left(-\frac{1}{6}\right)$ vi $\left(\frac{4}{6}\right)$

b i $\left(-\frac{1}{3}\right)$ ii $\left(-\frac{1}{3}\right)$ iii $\left(\frac{1}{-2}\right)$ iv $\left(\frac{4}{-2}\right)$
v $\left(-\frac{2}{3}\right)$ vi $\left(\frac{3}{3}\right)$

c i $\left(-\frac{1}{2}\right)$ ii $\left(-\frac{1}{2}\right)$ iii $\left(\frac{2}{3}\right)$ iv $\left(\frac{1}{1}\right)$
v $\left(-\frac{5}{4}\right)$ vi $\left(\frac{0}{4}\right)$

Exercise 8C
1

2 a–e

A reflection in the y-axis

3 b A'(2, −1), B'(5, 0), C'(-3, −3), D'(3, 2)
c y-value changes sign
d (a, −b)

4 b A'(-2, 1), B'(0, 5), C'(-3, −2), D'(4, −3)
c x-value changes sign
d (-a, b)

5

6 a–i

j A reflection in y = x

8 c A'(1, 2), B'(0, 5), C'(2, −3), D'(-4, −2)
d Coordinates are reversed: x becomes y and y becomes x

e (-b, a)

9 c A'(-1, -2), B'(-5, 0), C'(2, -3), D'(3, 4)
d Coordinates are reversed and change sign, x becomes -y and y becomes -x

e (-b, -a)

Exercise 8D

1 a

b i Rotation 90° anticlockwise
ii Rotation 180°

2

3 a 90° anticlockwise
b 270° anticlockwise
c 300° clockwise
d 260° clockwise

Exercise 8E

1

b i Rotation 60° clockwise about O
t Rotation 120° clockwise about O
tii Rotation 180° about O
tiv Rotation 240° clockwise about O
c i Rotation 60° clockwise about O
tii Rotation 180° about O

2

d All shapes are the same.

3

4 a

b 3:1
c 3:1
d 9:1

5 a–c
d Scale factor –\(\frac{1}{3}\), centre (1, 3) 
e Scale factor –2, centre (1, 3) 
f Scale factor –1, centre (–2.5, –1.5) 
g Scale factor –1, centre (–2.5, –1.5) 
h Same centres, and the scale factor are reciprocals of each other

Exercise 8F
1 A translation \((-\frac{1}{2}, 0)\), B reflection in y-axis, 
C rotation 90° clockwise about (0, 0), 
D reflection in \(x = 3\), E reflection in \(y = 4\), 
F enlargement by scale factor 2, centre (0, 1) 
2 a \(T_1\) to \(T_2\): rotation 90° clockwise about (0, 0) 
b \(T_1\) to \(T_3\): rotation 90° anticlockwise about (0, 0) 
c \(T_2\) to \(T_3\): translation \((-2\), 2) 
d \(T_4\) to \(T_5\): rotation 180° about (0, 0) 
e \(T_5\) to \(T_6\): reflection in y-axis 
f \(T_6\) to \(T_2\): rotation 180° about (0, 0) 
3 a–d e \(T_4\) to \(T_6\): rotation 90° anticlockwise about (0, 0) 

Exercise 9B
4 a i Construct 60° angle and bisect it 
   ii Bisect 30° angle 
   iii Construct 90° angle and bisect it to get 45°, then 
   bisect 45° angle 
   iv Construct 45° angle on upper arm of 30° angle 
8 b AC = 5.1 cm, BC = 6.3 cm 
9 b PR = 5.9 cm, RQ = 4.1 cm

Exercise 9C
1 a Circle with radius 2 cm 
b Circle with radius 4 cm 
c Circle with radius 5 cm 
2 a  
   b  
   c  
3 Circle with radius 4 m 
4 
5 a  
b  
c  

Exercise 9D
1 Fence Stake 
2  
3  
4 Fence Stake 
5 Fence Stake 
6 Fence Pen Stake 

ANSWERS: CHAPTER 9

7 a Sketch should show a circle of radius 6 cm around London and one of radius 4 cm around Glasgow.
   b No
   c Yes

9 a Yes
   b Sketch should show a circle of radius 4 cm around Leeds and one of radius 4cm around Exeter. The area where they overlap should be shaded.
   c The transmitter can be built anywhere on line constructed in part a that is within the area shown in part b.
   11 Sketch should show two circles around Birmingham, one of radius 3 cm and one of radius 5cm. The area of good reception is the area between the two circles.
   12 Sketch should show a circle of radius 6 cm around Glasgow, 2 circles around York, one of radius 4 cm and one of radius 6 cm and a circle around London of radius 8 cm. The small area in the Irish sea that is between the 2 circles around York and inside both the circle around Glasgow and the circle around London is where the boat can be.

Quick check

**Quick check**

1 a 7 b 6 c 8 d 6

**Exercise 10A**

1 Mode
2 Three possible answers: 12, 14, 14, 16, 18, 20, 24; or 12, 14, 14, 16, 18, 22, 24; or 12, 14, 14, 16, 20, 22, 24
3 33
4 a median (mean could be unduly influenced by results of very able and/or very poor candidates)
b median (mean could be unduly influenced by pocket money of students with very rich or generous parents)
c mode (numerical value of shoe sizes irrelevant, just want most common size)
d median could be distorted by one or two extremely short or tall performers
mode (the only way to get an "average" of non-numerical values)
f median (mean could be unduly influenced by very low weights of premature babies)

5 The median is 31.5 which rounds up to 32, so the statement is correct (though the mode and median are 31)
6 a £18,000 ii £24,000 iii £23,778
b A 6% rise would increase the mean salary to £25,204, a £1500 pay increase would produce a mean of £25,278
7 a Median b Mode c Mean
8 11.6 9 42.7 kg 10 24

**Exercise 10K**

1 11 + 6/2
2 a 2√3 - 3 b 3√2 - 8 c 10 + 4√5
d 12√7 - 42 e 15√2 - 24 f 9 - √3
3 a 2√3 b 1 + √5 c -1 - √2 d √7 - 30 e -41
f 7 + 3√6 g 9 + 4√5 h 3 - 2√3
i 11 + 6/2
4 a 3/2 cm b 2√3 cm c 2√10 cm
5 a √3 - 1 cm² b 2√5 + 5√2 cm²
c 2√3 + 18 cm²
6 a √3 b √2 c √5 d √6
7 a 7 b 6/2 + 6/2 c 25 + 5√5 d 5√5/2
8 a 18 b 19/2 c 21 d 23 e 25
9 a 5 b 6/2 + 6/2 c 6 + 6/2 d 6
f 2√3 g 3√2 h 4/2 i 10√3 j 6/2

**Exercise 10B**

1 a 7 b 6/2 + 6/2 c 8.5 d 8.2
2 a 668 b 1.9 c 0 d 328
3 a 2.2, 1.7, 1.3 b Better dental care
4 a 50 b 2 c 2.8
5 a Roger 5, Brian 4 b Roger 3, Brian 8
c Roger 5, Brian 4 d Roger 5.4, Brian 4.5
e Roger, smaller range f Brian, better mean
6 a 40 b 7 c 3 d 2 e 2.5 f 2.5
g 2.4
h 2.5
i 3
j 3

**Exercise 10C**

1 a 30 < x ≤ 40 b 0 < y ≤ 100 c 158.3
d 15 < z < 10 e 5 < z ≤ 10 f 9.43 g 7 ≥ z ii 8.41
2 a 100 g < w < 120 b 10.86 kg c 108.6 g
3 a 175 < h ≤ 200 b 31% c 193.3 hours d No
4 a Yes, average distance is 11.7 miles per day b Because shorter runs will be done faster which will affect the average.
c Yes because the shortest could be 1 mile, the longest 25 miles
5 24
6 Soundbuy: average increases are Soundbuy 17.7p, Springfields 18.7p, Setco 18.2p
Exercise 11D

1 b 1.7
2 b 2.8
3 a i 17, 13, 6, 3, 1 ii £1.45
   b ii £5.35
   c Much higher mean. Early morning, people just want a paper or a few sweets, later people are buying food for the day.
4 c 140.4 cm
5 b Monday 28.4 min, Tuesday 20.9 min, Wednesday 21.3 min
   c There are more patients on a Monday, and so longer waiting times, because the surgery is closed at the weekend

Exercise 11E

1 The respective frequency densities on which each histogram should be based are
   a 2.5, 6.5, 6, 2, 1, 1.5  b 4, 27, 15, 3  c 17, 18, 12, 6.67  d 0.4, 1.2, 2.8, 1  e 9, 21, 13.5, 9

Exercise 11F

1 Moving averages are: 9.3, 9.1, 9.0, 9.1, 8.7, 8.6, 9.1, 9.0, 9.4, 9.7, 9.7, 9.9, 10.1, 9.7, 9.9, 9.4, 9.9, 10.0, 10.0, 9.9, 10.1, 10.7
2 a Moving averages are: 44.5, 42.3, 41.0, 41.3, 42.3, 44.5, 45.8
   b Amounts raised dip in the middle of the collection period
3 a Moving averages are: 108.10, 107.24, 108.30, 105.89, 109.54, 111.40, 112.55, 118.70, 118.50, 119.80, 120.30, 123.18, 124.33
   b Gradually rises
   c Trend suggests next moving average about £125.50, so estimated first quarter 2006 bill is £137.29
4 b Moving averages are: 80, 81, 82, 83, 82, 85, 87, 90, 94, 92, 91, 89, 86
   c Recent fall may be due to moving to cheaper provider or using e-mail rather than making calls
   d Trend suggests next moving average about 83.5, so first quarter 2006 bill is £78
   b Apart from a blip in June 2004, sales showing slight improvement
   c Trend suggests next moving average about 14.6, so January 2006 sales estimate is 15
   d Trend suggests next moving average about 14.5, so estimated first quarter 2006 bill is £110.30, £110.50, £112.50, £114.50

Exercise 11H

1 a It is a leading question, and there is no option to disagree with the statement
   b Unbiased, and the responses do not overlap
2 a Responses overlap
   b Give as options: up to £2, more than £2 and up to £5, more than £5 and up to £10, more than £10

Exercise 11I

1 Price 78p, 80.3p, 84.2p, 85p, 87.4p, 93.6p
2 a £1 = $1.80  b Greatest drop was from June to July
   c There is no trend in the data
3 a 9.7 million  b 4.5 years  c 12 million  d 10 million
4 £74.73
5 a Holiday month  i 138–144 thousand  ii 200–210 thousand
Quick check
1 a -3x  b 2x  c -3x  d 6m^2
2 a -6  b \frac{-1}{2}  c \frac{1}{2}

Exercise 12A
1 x^2 + 5x + 6
2 x^4 + 2x^3 - 10x^2 + 16x - 10
3 x^3 + 12
4 x^3 + 6x^2 + 1
5 a^2 - 5a + 4
6 a^2 - 2x + 3
7 x^3 + x - 12
8 x^2 - 2x - 15
9 a^2 + 9a + 2
10 x^2 + 9x + 2
11 x^2 + x - 12
12 x^2 - 7x + 12
13 x^2 - 5 + 8x - 10
14 x^2 + 5x + 3
15 x^2 + 2x - 6
16 x^2 - 9
17 a^2 + 2a - 3
18 m^2 - r^2 - 16
19 m^2 - 10x^2
20 x^2 - 4

Exercise 12B
1 6x^2 + 11x + 3
2 12x^2 + 17x + 6
3 6x^2 + 17x + 5
4 5x^2 - 11x - 6
5 10x^2 - 11x - 15
6 11x^2 - 14x - 9
7 9x^2 + 16x - 4
8 12x^2 + 5x - 2
9 6x^2 + 11x + 4
10 4x^2 + 9x - 1
11 12x^2 + 7x + 2
12 16x^2 - 10x^3
13 19x^2 + 10x^3
14 20x^2 - 7x - 6
15 21x^2 - 10x - 6

Exercise 12C
1 4x^2 - 1
2 9x^2 - 4
3 4a^2 - 9
4 16m^2 - 9
5 9x^2 - k^2
6 14a^2 - 9
7 5 - 9x^2
8 25 - 4t^2
9 36 - 25y^2
10 a^2 - b^2
11 14a^2 - 9
12 35x^2 - 9
13 25x^2 - 9

Exercise 12D
1 x^2 + 10x + 25
2 x^2 + 8x + 9
3 r^2 + 12r + 36
4 p^2 + 6p + 9
5 m^2 - 6m + 9
6 t^2 - 10t + 25
7 x^2 - 11x + 36
8 x^2 - 14x + 49
9 9a^2 + 6x + 1
10 16y^2 + 24y + 9
11 25x^2 + 20y + 4
12 4n^2 + 12n + 9
13 25x^2 - 24x + 9
14 9x^2 + 12x - 4
15 15x^2 - 20x + 4
16 17x^2 + 22y^2
17 18x^2 - 20n^2 + m^2
18 22x^2 + 4y^2 + y^2
19 25x^2 + 12x + 12
20 24x^2 - 4x

Exercise 12E
1 (x - 2)(x + 3)
2 (t + 1)(y + 4)
3 (m + 2)(n + 5)
4 (p + 2)(p + 12)
5 (x + 3)(x + 4)
6 (a + 2)(a + 6)
7 (f + 1)(f + 21)
8 (d - 4)(d - 1)

7 (2x + 3)(2x - 3)
8 (6x + 8)(5x - 8)
9 (2x + 3)(4x - 1)
10 (2x + 1)(x + 1)

Exercise 12H
1 -2, -5 2 -3, -1
3 -6, -4 4 1, -2
5 1, -2 6 -4, 5
7 1, -2 8 1, -2
9 3, -5 10 2, -6, 3
11 2, -5 12 1, 2

Exercise 12I
1 a \frac{1}{2} \ b \frac{1}{4}  c \frac{1}{3}  d \frac{1}{2}  e \frac{1}{4}  f \frac{1}{9}  g \frac{1}{6}  h \frac{1}{8}  i \frac{1}{2}
2 a \frac{1}{2} \ b \frac{1}{2}  c \frac{1}{3}  d \frac{1}{2}  e \frac{1}{2}  f \frac{1}{2}  g \frac{1}{2}  h \frac{1}{2}  i \frac{1}{2}
3 a 2 \ b \frac{1}{2}  c \frac{1}{2}  d \frac{1}{2}  e \frac{1}{2}  f \frac{1}{2}  g \frac{1}{2}  h \frac{1}{2}  i \frac{1}{2}
4 a \frac{1}{2} \ b \frac{1}{2}  c \frac{1}{2}  d \frac{1}{2}  e \frac{1}{2}  f \frac{1}{2}  g \frac{1}{2}  h \frac{1}{2}  i \frac{1}{2}

Exercise 12J
1 1.77, -2.27 2 -0.23, -1.43
3 3.70, -2.70 4 0.29, -0.69
6 1.23, -2.43 7 0.41, -1.84
9 1.37, -4.37 10 1.59, -4.19
11 0.36, -0.79 13 1.89, 0.11
14 0.36, -0.79

Exercise 12K
1 a \sqrt{x + 3}  b \sqrt{x - 3}  c \sqrt{x - 3}  d \sqrt{x + 3}  e \sqrt{x - 3}  f \sqrt{x + 3}  g \sqrt{x + 3}  h \sqrt{x + 3}  i \sqrt{x + 3}
2 a \sqrt{x^2 - 3}  b \sqrt{x^2 + 3}  c \sqrt{x^2 - 3}  d \sqrt{x^2 + 3}  e \sqrt{x^2 - 3}  f \sqrt{x^2 + 3}  g \sqrt{x^2 - 3}  h \sqrt{x^2 - 3}  i \sqrt{x^2 - 3}
3 a -2 \ b -3 \ c -4 \ d -5 \ e -6 \ f -7 \ g -8 \ h -9 \ i -10
4 a 1.45, -3.45  b 5.32, -1.32  c -4.16, 2.16

Exercise 12L
1 52, 2 2 65, 2 3 24, 2 4 85, 2
5 145, 2 6 68, 2 7 35, 0 8 23, 0
9 41, 2 10 40, 2 11 135, 0 12 37, 2
Exercise 12M
1 a $1 \pm \sqrt{5}$ b $-1 \pm 2\sqrt{2}$ c $-2 \pm 4\sqrt{3}$
   d $-1 \pm \sqrt{14}$ e $4 \pm \sqrt{14}$ f $2 \pm \sqrt{2}$
2 a $-1 \pm \frac{\sqrt{14}}{2}$ b $-1 \pm \frac{3\sqrt{2}}{2}$ c $-3 \pm \sqrt{19}$
   d $5 \pm \sqrt{39}$ e $-1 \pm \sqrt{61}$ f $-3 \pm \sqrt{33}$

Exercise 13A
1 a 9 am i ii 10 am ii 12 noon
   b i 40 km/h ii 120 km/h iii 40 km/h
2 a i 125 km ii 125 km/h
   b i between 2 pm and 3 pm ii about 12 1/2 km/h
3 a i 263 m/min (3 sf) ii 15.8 km/h (3 sf)
   b i 500 m/min ii Paul by 1 minute
4 a Patrick ran quickly at first, then had a slow middle section but he won the race with a final sprint. Araf ran steadily all the way and came second. Sean set off the slowest, speeded up towards the end but still came in third.
   b i 1.67 m/s ii 6 km/h

Exercise 13B
1 a $\frac{\sqrt{3}}{2}$ b $\frac{\sqrt{5}}{2}$ c $\frac{\sqrt{8}}{2}$ d $\frac{\sqrt{10}}{2}$ e $\frac{\sqrt{5}}{2}$ f $\frac{\sqrt{7}}{2}$
2 a $21 \pm 2$ km/h b $3.75$ m/s c $21 \pm 2$ km/h

Exercise 13C
1 a $20$ m/s² b $7.1$ m/s
2 a $3.5$ m/s² b $3.5$ m/s²
3 a between 2 and 4 hours, and between 8 and 10 hours
   b $10$ km/h², $0$ km/h², $5$ km/h², $0$ km/h², $-6.25$ km/h², $-3.75$ km/h²

Exercise 13D
1 a

da 9 a \frac{1}{2} b 21 \text{ cm}^2
Exercise 16B
1  a  2  3  4  5  6  7  8  9  10
   a  b  c  d  e  f  g  h  i  j

   y = \frac{1}{2}x - 3
   y = 3x + 5
   y = \frac{3}{2}x + 4

Exercise 16C
1  y = 2x + 6, y = 3x - 4, y = \frac{1}{2}x + 5, y = x + 7
   y = \frac{1}{2}x - 2
   y = \frac{1}{2}x + 1

No, because the lines are parallel.

b  (3, 7)

3  a  b  c  d  e  f  g  h  i  j

   y = 3x + 1
   y = 3x - 2

Exercise 16C
1  y = 2x + 6, y = 3x - 4, y = \frac{1}{2}x + 5, y = x + 7
   y = \frac{1}{2}x - 2
   y = \frac{1}{2}x + 1

Exercise 16B
1  a  2  3  4  5  6  7  8  9  10
   a  b  c  d  e  f  g  h  i  j

   y = \frac{1}{2}x - 3
   y = 3x - 7, y = \frac{1}{2}x - 3, y = \frac{1}{3}x + 4

Exercise 16C
1  y = 2x + 6, y = 3x - 4, y = \frac{1}{2}x + 5, y = x + 7
   y = \frac{1}{2}x - 2
   y = \frac{1}{2}x + 1

Exercise 16D

1. $3x + 2y = 6, 4x + 3y = 12, 4x - 5y = 20, x + y = 10$

2. (2, 0)

3. (3, 6)

4. (4, 2)
**Exercise 16E**

1a \( y = \frac{3}{4}x - 2 \) or \( 3y = 4x - 6 \)  
1b \( y = x + 1 \)  
1c \( y = 2x - 3 \)  
1d \( 2y = x + 6 \)  
1e \( y = x \)  
1f \( y = 2x \)  
2a \( y = 2x + 1 \), \( y = -2x + 1 \)  
2b \( 5y = 2x - 5 \), \( 5y = -2x - 5 \)  
2c \( y = x + 1 \), \( y = -x + 1 \)  
2d \( y = 2x - 1 \)  
2e \( y = 3x - 3 \)  
2f \( y = -2x + 1 \)  
3a \( y = -2x + 1 \)  
3b \( 2y = -x \)  
3c \( y = -x + 1 \)  
3d \( 5y = -2x - 5 \)  
4a \( y = 2x - x + 1 \), \( y = -2x + 1 \)  
4b \( 2y = 5x + 5 \), \( 5y = 2x - 5 \)  
4c \( y = 2, x = 2 \)  
4d \( y = x \)  
4e \( y = \frac{3}{2}x + 3 \)  
4f \( y = x \)  

**Exercise 16F**

1a \( 32^\circ \)  
1b \( \frac{2}{3} \) (Take gradient at \( C = 10^\circ \) and \( 30^\circ \))  
1c \( F = \frac{3}{2} \)  
2a \( 0.07 \) (Take gradient at \( U = 0 \) and \( 500^\circ \))  
2b \( \£10 \)  
2c \( C = \£(10 + 0.07U) \) or Charge = \£10 + 7/p/unit  
3a \( \frac{2}{3} \) (Take gradient at \( D = 0 \) and 40.)  
3b \( \£20 \)  
3c \( C = \£(20 + \frac{50}{2}) \) or Charge = \£20 + £2.50/day  
4a \( \frac{4}{7} \) (Take gradient at \( N = 0 \) and \( 500^\circ \))  
4b \( \£50 \)  
4c \( C = \£(50 + \frac{N}{2}) \) or \£50 + 50p/person  
5a \( \frac{4}{17} \)  
5b \( 24.5 \) cm  
5c 0.1 cm or 1 mm  
5d \( \angle = 24.5^\circ + \frac{\pi}{W} \) or Length = 24.5 + 1 mm/kg

**Exercise 16G**

1  
1a \( \frac{3}{2} \) \( \frac{3}{2} \)  
1b \( \frac{1}{2} \)

Exercise 17H

Quick check
1 29.0

Exercise 18A
1 b About 328 million c Between 1980 and 1985 d Rising living standards
2 b Smallest difference Wednesday (7°), greatest difference Friday (10°)

Exercise 18B
1 a 2 8 9 2 3 4 5 6 8 8 9 3 4 1 1 3 3 3 8 8 4 0 43 cm b 39 cm d 20 cm
2 a 0 2 8 9 9 9 1 2 3 7 8 2 0 1 2 3 b 9 messages c 15 messages

Exercise 18C

1a Positive correlation, reaction time increases with amount of alcohol drunk.
1b Negative correlation, you drink less alcohol as you get older.
1c No correlation, speed of cars on MI is not related to the temperature.
1d Weak, positive correlation, older people generally have more money saved in the bank.

2c \( \approx 19 \text{ cm/s} \)
2d \( \approx 34 \text{ cm} \)

3c Greta
3d \( \approx 67 \)
3e \( \approx 72 \)

Exercise 18D

1a cumulative frequency 1, 4, 10, 22, 25, 28, 30
1b cumulative frequency 1, 3, 5, 14, 31, 44, 47, 49, 50
1c cumulative frequency 12, 30, 63, 113, 176, 250, 314, 349, 360
1d cumulative frequency 2, 5, 10, 16, 22, 31, 39, 45, 50

Exercise 18E

1b The students are much slower than the pensioners. Although both distributions have the same inter-quartile range, the students’ median and upper quartile are 1 minute, 35 seconds higher. The fastest person to compete the calculations was a student, but so was the slowest.

2a The resorts have similar median temperatures, but Resort B has a much wider temperature range. The greatest extremes of temperature are recorded in Resort B.
2b Resort A is probably a better choice as the weather seems more consistent.

3b Both distributions have a similar inter-quartile range, and there is little difference between the upper quartile values. Men have a wider range of salaries, but the higher men’s median and the fact that the men’s distribution is negatively skewed and the women’s distribution is positively skewed indicates that men are better paid than women.

4b £1605, £85

ANSWERS TO CHAPTER 19

Quick check

1a Perhaps around 0.6  
1b Very close to 1  
1c Very close to 0  
1d 1  
1e 1

Exercise 19A

1b 6
1c 1
1d 1–6
1e 1000

2a 10  
2b 40
2c No, it is weighted towards the side with numbers 4 and 5
2d 32 is too high, 20 of the 50 throws between 50 and 100 unlikely to be 5

Exercise 19B

1b 8

4a 0.346, 0.326, 0.294, 0.305, 0.303, 0.306

5 b 3  c 2 1
6 a 40%  b 45%
   c No as you don’t know how much the people who get
      over £350 actually earn

Exercise 19E
1 a 1 1  b 3 1  c 1 1
2 a 1 1  b 3 1  c 1 1
3 a 1 1  b 3 1  c 1 1
4 a 1 1  b 3 1  c 1 1
5 a 1 1  b 3 1  c 1 1  d 1 1  e 1 1
6 a 0.6  b 120
7 a 0.8  b 0.2
8 a 0.75  b 0.6  c 0.5  d 0.6
   e i Cannot add P(red) and P(1) as events are not
      mutually exclusive  ii 0.75
9 a 0.3  b 0.7  c 0.3
10 Probability cannot exceed 1, and probabilities cannot be
    summed in this way as events are not mutually exclusive

Exercise 19F
1 a 7  b 2 12
2 c P(2) = 1 16  P(3) = 1 16  P(4) = 1 16  P(5) = 1 16  P(6) = 1 16
   P(7) = 1 16  P(8) = 1 16  P(9) = 1 16  P(10) = 1 16  P(11) = 1 16
   P(12) = 1 16
3 d i 1 12  ii 1 12  iii 1 12  iv 1 12  v 1 12  vi 1 12

7 a 0.162  b 0.162  c 0.378

Exercise 19J
1 a 1 256  b 256  c 256  d 256
2 a 1 256  b 256  c 256  d 256

ANSWERS: CHAPTER 19

3 a \( \frac{1}{2} \) b \( \frac{1}{8} \) c \( \frac{1}{6} \) d \( \frac{1}{9} \) e \( \frac{1}{9} \)
4 a 0.154 b 0.456
5 a 0.302 b 0.4404 c 0.7428
6 a 0.9 b 0.6 c 0.54 d 0.216
7 a 0.6 b 0.6 c 0.432 d Independent events
8 a \( \frac{1}{2} \) b \( \frac{1}{3} \) c \( \frac{1}{7} \) d \( \frac{1}{9} \)
9 a 0.126 b 0.4 c 0.42 d 0.054

Exercise 19K
1 a \( \frac{1}{2} \) b 50
2 a \( \frac{1}{2} \) b 0 c \( \frac{1}{2} \) \( \frac{1}{2} \) \( \frac{1}{2} \) \( \frac{1}{2} \)

ANSWERS TO CHAPTER 20

Quick check
1 a 17, 20, 23 b 28, 36, 45 c 15, 10, 5
d 49, 64, 81
2 a 1 b 4 c 7
3 a \( x(x - 1) \) b \( 2x(5x + 1) \)
4 a \( x^2 + 8x + 12 \) b \( 2x^2 - 5x - 3 \) c \( x^2 - 4x + 4 \)
5 a \( x = 3 - 2y \) b \( x = 4 + 3y \) c \( x = 4y - 3 \)

Exercise 20A
1 a \( \frac{5x}{6} \) b \( \frac{19x}{20} \) c \( \frac{23x}{20} \) d \( \frac{3x + 2y}{6} \) e \( \frac{x^2y}{8} \)
f \( \frac{5x + 7}{6} \) g \( \frac{7x - 3}{4} \) h \( \frac{13x - 5}{15} \) i \( \frac{3x - 1}{4} \)

2 a \( \frac{x}{5} \) b \( \frac{11x}{20} \) c \( \frac{7x}{20} \) d \( \frac{3x - 2y}{6} \) e \( \frac{x^2y}{8} \)
f \( \frac{x - 1}{6} \) g \( \frac{x - 1}{4} \) h \( \frac{x - 7}{5} \)
i \( \frac{x - 1}{4} \) j \( \frac{-8x + 7}{10} \)

3 a \( \frac{3}{5} \) b \( \frac{6}{7} \) c \( \frac{2}{5} \) d \( \frac{5}{6} \) e \( \frac{3}{4} \)

4 a \( \frac{x^2}{6} \) b \( \frac{3x + y}{14} \) c \( \frac{8}{3} \) d \( \frac{2x^2}{3} \) e \( \frac{x^2 - 2x}{10} \)
f \( \frac{1}{8} \) g \( \frac{6x + 5x + 1}{8} \)

5 a \( \frac{3}{7} \) b \( \frac{x}{7} \) c \( \frac{8}{3} \) d \( \frac{2x^2}{3} \) e \( \frac{5x}{2x - 4} \)
f \( \frac{2x^2 - 12x + 18}{75} \) g 1 h \( \frac{1}{4x + 2} \)
i \( \frac{x^2 - 5x + 6}{48} \) j \( \frac{1}{2x} \)

Exercise 20B
1 a (5, –1) b (4, 1) c (3, –1)
2 a (1, 2) and (–2, –1) b \( x = -4, y = 1; x = -2, y = 2 \)
3 a (3, 4) and (4, 3) b (0, 3) and (–3, 0) c (3, 2) and (–2, 3)
4 a (2, 5) and (–2, –3) b (1, –2) and (4, 3) c (3, 3) and (1, –1)
5 a (2, 4) b (1, 0) c The line is a tangent to the curve

Exercise 20C
1 a 21, 54: add previous 2 terms b 49, 64; next square number c 47, 76: add previous 2 terms
2 15, 21, 28, 36
3 61, 91, 127
4 \( \frac{2}{5}, \frac{3}{5}, \frac{4}{5} \)
5 a 6, 10, 15, 21, 28 b It is the sums of the natural numbers, or the numbers in Pascal’s Triangle.

Exercise 20D
1 a 13, 15, 2x + 1 b 25, 29, 4x + 1
c 33, 38, 5x + 3 d 32, 38, 6x – 4
e 20, 23, 3x + 2 f 37, 44, 7x – 5
g 21, 25, 4x – 3 h 23, 27, 4x – 1
i 17, 20, 3x – 1 j 42, 52, 10x – 8
k 24, 28, 4x + 4 l 29, 34, 5x – 1
Exercise 20E

1. a 4n – 3  
   b 97  
   c 50th diagram  
   d 97  

2. a 2n + 1  
   b 121  
   c 49th set

Exercise 20F

1. a 35, 48  
   b 38, 51  
   c 39, 52  
   d 34, 47  
   e 35, 46  
   f 35, 46  
   g 35, 46  
   h 41, 54  
   i 48, 63  
   j 48, 63

2. a 79, 8 km  
   b 162  
   c 79, 8 km

3. a i n + 2  
   b i 3n + 2  
   c i 41  
   d i 61  
   e i 20

4. a 2n – 3n + 2  
   b 3n + 2n – 3  
   c 2n + 2 + n + 1

Exercise 20G

1. a 8y  
   b x  
   c \frac{3}{4} \sqrt{b + 5c}

2. a \frac{2}{3} \sqrt{p + q}  
   b \frac{4}{5} \sqrt{a - p}  
   c \frac{6}{7} \sqrt{p + q}

3. a \frac{u}{\sqrt{1 - d}}  
   b \frac{2a}{\pi}  
   c \frac{2A}{\pi + \sqrt{L^2 - 1}}

4. a \frac{b}{R}  
   b \frac{a}{R}

5. a \frac{2}{3} \sqrt{y^2 + 2y}  
   b \frac{2x + 2y}{x + y}

6. a \frac{3}{5} \sqrt{x^2 + 3x}  
   b \frac{3V}{r^2}  
   c \frac{3V}{\sqrt{2}x}

7. a \frac{2W}{z + y}  
   b \frac{2W - 2x}{z + y}

Exercise 21B

1. a \frac{a^2 + ab}{2}  
   b \frac{3b}{2}  
   c \frac{5a}{2}  
   d \frac{9a}{2}  

2. a \frac{a^2 + ab}{2}  
   b \frac{3b}{2}  
   c \frac{5a}{2}  
   d \frac{9a}{2}  

3. a \frac{a^2}{2}  
   b \frac{3b}{2}  
   c \frac{5a}{2}  
   d \frac{9a}{2}  

4. a \frac{a^2}{2}  
   b \frac{3b}{2}  
   c \frac{5a}{2}  
   d \frac{9a}{2}  

5. a \frac{a^2}{2}  
   b \frac{3b}{2}  
   c \frac{5a}{2}  
   d \frac{9a}{2}  

6. a \frac{a^2}{2}  
   b \frac{3b}{2}  
   c \frac{5a}{2}  
   d \frac{9a}{2}  

7. a \frac{a^2}{2}  
   b \frac{3b}{2}  
   c \frac{5a}{2}  
   d \frac{9a}{2}  

8. a \frac{a^2}{2}  
   b \frac{3b}{2}  
   c \frac{5a}{2}  
   d \frac{9a}{2}  

9. a \frac{a^2}{2}  
   b \frac{3b}{2}  
   c \frac{5a}{2}  
   d \frac{9a}{2}  

10. a \frac{a^2}{2}  
    b \frac{3b}{2}  
    c \frac{5a}{2}  
    d \frac{9a}{2}
Exercises 21D

1. a A b L c L d A e V f V g V
   h A i L j V k A l M v n A
   o V p a q V r A s A t A u L
   v A w A x A y V z V

3. a C L b l c C V d C L e l
   f l g C V h C V i C V j C V
   k C L l I m C V

4. a 2 b 2.3 c 2 d 2.2

5. Inconsistent

6. a A is $F_r$, B is $F_a$, C is $F_h$
   b $F_r$ is the total length of the curved edges

Exercise 22A

1. a 15
   b 2

2. a 75
   b 6

3. a 150
   b 6

4. a 22.5
   b 12

5. a 175 miles
   b 8 hours

6. a 566.50
   b 175 kg
   c 84 m³

Exercise 22B

1. a 100
   b 10

2. a 27
   b 5

3. a 56
   b 1.69

4. a 192
   b 2.25

5. a 25.6
   b 5

Exercise 22C

1. a 7m = 12
   b 3
   c 2.5

2. a 60
   b 20
   c 6

3. a $Q + \theta = 16$
   b 3.2
   c 4

4. a 15
   b 5

5. a $Wu = 24$
   b 4.8
   c 100

6. a $gp = 1800$
   b 87.5
   c 36

7. a $td = 24$
   b 3°C
   c 12 km

8. a $dx = 432$
   b 1.2 km
   c 8 m/s

9. a $pv = 7.2$
   b 2.4 atm
   c 100 m

10. a $WuF = 0.5$
    b 5 $t/h$
    c 0.58 $t/h$

Exercise 23A

1. a $5.5 < 7 < 7.5$
   b $5.5 < 6 < 6.5$
   c $5.5 < 6 < 6.5$
   d $5.5 < 6 < 6.5$
   e $5.5 < 6 < 6.5$
   f $5.5 < 6 < 6.5$
   g $5.5 < 6 < 6.5$
   h $5.5 < 6 < 6.5$
   i $5.5 < 6 < 6.5$
   j $5.5 < 6 < 6.5$
   k $5.5 < 6 < 6.5$
   l $5.5 < 6 < 6.5$
   m $5.5 < 6 < 6.5$
   n $5.5 < 6 < 6.5$
   o $5.5 < 6 < 6.5$
   p $5.5 < 6 < 6.5$
   q $5.95 < 6 < 6.5$
   r $5.95 < 6 < 6.5$
   s $5.95 < 6 < 6.5$

2. a $50 < 50 < 50$
   b $50 < 50 < 50$
   c $50 < 50 < 50$
   d $50 < 50 < 50$
   e $50 < 50 < 50$
   f $50 < 50 < 50$
   g $50 < 50 < 50$
   h $50 < 50 < 50$
   i $50 < 50 < 50$
   j $50 < 50 < 50$

   r $50 = 50 = 50$
   s $50 = 50 = 50$

Exercise 23B

1. a 7.5
   b 8.5
   c 25.5
   d 26.5

2. a 84.5
   b 85.5
   c 24.5
   d 25.5
   e 0.15
   f 0.25

3. a $C L b l C C V d C L e l$
   f l g C V h C V i C V j C V
   k C L l I m C V

4. a 2 b 2.3 c 2 d 2.2

5. Inconsistent

6. a A is $F_r$, B is $F_a$, C is $F_h$
   b $F_r$ is the total length of the curved edges

Quick Check

1. a 25
   b 9
   c 27

2. a 48
   b 2

Exercise 23C

1. a $38.25 cm² < area < 52.25 cm²$
   b $37.1575 cm² < area < 38.4475 cm²$
   c $135.625 cm² < area < 145.225 cm²$

2. a $5.5 m < length < 6.5 m$, $3.5 m < width < 4.5 m$
   b $29.25 m²$
   c $18 m$
   d $79.75 m² < area < 100.75 m²$
   e $216.125 m³ < volume < 354.375 m³$
   f $20.9 m < length < 22.9 m (3 sf)$
   g $16.43 cm² < area < 21.75 cm² (3 sf)$

7. a $64.1 cm² < volume < 69.6 cm³ (3 sf)$
   b $222.609 < price < 224.509 (nearest £)$
   c $23643 < price < 23661 (nearest £)$
   d $5.90 cm (3 sf)$
   e $17.85 cm² (3 sf)$

8. a $5.65, 0.065$
   b $250 g, 350 g$
   c $0.65, 0.75$
   d $365.5, 366.5$
   e $165, 175$
   f $205, 215$

9. a $< 65.5$
   b $64.5 g$
   c $< 2620 g$
   d $2580 g$

10. a $14.65 s < time < 14.75 s$
    b $99.5 m < length < 100.5 m$
    c $6.86 m/s (3 sf)$
    d $222.609 < price < 224.509 (nearest £)$
    e $23643 < price < 23661 (nearest £)$
    f $5.90 cm (3 sf)$
    g $17.85 cm² (3 sf)$
    h $250 g, 350 g$
    i $0.65, 0.75$
    j $365.5, 366.5$
    k $165, 175$
    l $205, 215$

11. $5.80 cm < length < 5.90 cm (3 sf)$

12. $14 s < time < 30 s$
Quick check

1 a 8   b 10

2 a
\[ y = 3x + 1 \]

Exercise 24A

1 a \( x < 3 \)   b \( t > 8 \)   c \( p > 10 \)   d \( x < 5 \)

2 a \( x < 3 \)   b \( t > 8 \)   c \( p > 10 \)   d \( x < 5 \)

Exercise 24B

1 a \( x > 1 \)   b \( x < 3 \)   c \( x < 2 \)   d \( x > -1 \)   e \( x < -1 \)   f \( x > 1 \)

Exercise 24C

1 -2 \( \leq x \leq 2 \)

2 \( x > 5, x < -5 \)

3 -7 \( < x < 7 \)

4 \( x \geq 1, x < 1 \)

5 \( x \geq 3, x < -3 \)

6 \( x > 3, x < -3 \)

7 \( -2 \leq x < 2 \)

8 \( -4 < x < 4 \)

9 \( x > 1, x < -1 \)

10 \( x > 3, x < -3 \)

11 \( x > 2, x < -2 \)

12 \( -3 < x < 3 \)
Exercise 24D

1. \( y = 2 \)
2. \( y = -1 \)
3. \( y = -3 \)
4. \( y = 4 \)
5. a. \( y = 4 \)
   b. i. Yes
      ii. Yes
      iii. No
6. \( y = 2x - 1 \)
7. \( y = 2 \)
8. \( y = 5x + 1 \)
9. \( y = -2 \)
Exercise 24E
1 a £148x b £125y c £(148x + 125y)
2 a £(4x + By) b £(4x + 2By) c £(2Ax + (9 + y)B)
3 a May be true b Must be false c May be true, e.g. x = 30, y = 20 d May be true, e.g. x = 3, y = 40
4 a May be true b May be false c Must be false
5 E Excels hold 40E, S Storms hold 50S. There must be at least 1500 seats, so 40E + 50S ≥ 1500. Cancelling through by 10 gives 4E + 5S ≥ 150
6 a W rides cost £1.50W. This cannot exceed £6.00, so 1.50W ≤ 6.00. Cancelling through by 1.5 gives W ≤ 4
   b Likewise 2D ≤ 6, giving D ≤ 3
   c Total cost is 1.50W + 2D ≤ 6.00. Multiplying through by 2 gives 3W + 4D ≤ 12
   d D ≤ 2 e i Yes ii No iii No iv Yes
7 a 45x + 25y ≤ 200 ⇒ 9x + 5y ≤ 40 b y ≥ x + 2
8 a i Cost 30x + 40y ≤ 300 ⇒ 3x + 4y ≤ 30 ii At least 2 apples, so x ≥ 2 iii At least 3 pears, so y ≥ 3
   iv At least 7 fruits, so x + y ≥ 7
9 a i Space 4x + 3y ≤ 48 ii Cost 300x + 500y ≤ 6000 ⇒ 3x + 5y ≤ 60 b i Yes ii No iii No iv Yes
10 a i Number of seats required is 40x + 50y ≥ 300 ⇒ 4x + 5y ≥ 30 ii Number of 40-seaters x ≤ 6
   iii Number of 50-seaters y ≤ 5 b i Yes ii Yes iii Yes iv Yes
   c Combination ii, which costs £760
d Five 40-seaters and two 50-seaters cost £740

Quick check
a \(\begin{pmatrix} 1 \\ 3 \end{pmatrix}\) b \(\begin{pmatrix} 3 \\ 0 \end{pmatrix}\) c \(\begin{pmatrix} -2 \\ -1 \end{pmatrix}\) d \(\begin{pmatrix} -1 \\ 0 \end{pmatrix}\)

Exercise 25A
1 a Any 3 of AC, CF, BD, BA, GC, ER, HK, JR b Any 3 of BE, AB, BS, GJ, FJ, IK
   c Any 3 of AC, CF, BK, BD, GB, IC, JH, HE d Any 3 of BD, EB, BE, BA, GC, ER, KJ, IP
2 a 2a b 2b c a - b d 2a + b e 2a + 2b f a + 3b g a + b h 2a + 2b i 3a + b
   j 2a k b l 2a + b
3 a Equal b AD, BD, BK
4 a \(\overrightarrow{OJ} = 2\overrightarrow{OD}\) and parallel b AR c CF, BI, ER
5

6 a Lie on the same straight line b All multiples of a + b and start at O c H d i \(\overrightarrow{OJ} = a + \frac{1}{2}b\) ii \(\overrightarrow{OH} = 3a + \frac{3}{2}b\)
e \(\overrightarrow{OH} = \frac{2}{2}b\)
7 a - b b 3a - b c 2a - b d a - b e a + b f a + b g 2a - b h -a - 2b i a + 2b
   j -a + b k 2a - 2b l a - 2b
Exercise 25B

1. i -a + b  ii \(\frac{1}{2}(-a + b)\)  iii \(\frac{1}{2}a + \frac{1}{2}b\)  iv \(\frac{1}{2}a + \frac{1}{2}b\)  

2. i -a - b  ii \(-\frac{1}{2}a - \frac{1}{2}b\)  iii \(\frac{1}{2}a - \frac{1}{2}b\)  iv \(\frac{1}{2}a - \frac{1}{2}b\)  

3. a  b  c  d  e  

4. i -a + b  ii \(-\frac{1}{2}a + \frac{1}{2}b\)  iii \(\frac{3}{2}a + \frac{1}{2}b\)  b  \(\frac{3}{2}a + \frac{1}{2}b\)  

5. i \(\frac{1}{2}b\)  ii \(\frac{3}{2}a + \frac{1}{2}b\)  iii \(-\frac{1}{2}b\)  b  \(\frac{3}{2}a - \frac{1}{2}b\)  c  \(\overrightarrow{DE} = \overrightarrow{DC} + \overrightarrow{CE} = \frac{3}{2}a - \frac{1}{2}b\)  

6. a  \(\overrightarrow{CD} = -a + b = b - a\)  b  \(\overrightarrow{CD} = -a + b\)  c  \(\overrightarrow{CD} = -a + b = b - a\)  d  \(\overrightarrow{CD} = -a + b\)  e  \(\overrightarrow{CD} = -a + b\)  

7. a  \(\overrightarrow{CD} = \sqrt{1^2 + 1^2} = \sqrt{2}\)  b  \(\overrightarrow{CD} = \sqrt{1^2 + 1^2} = \sqrt{2}\)  c  \(\overrightarrow{CD} = \sqrt{1^2 + 1^2} = \sqrt{2}\)  

8. a i -a + b  ii \(-\frac{1}{2}a + \frac{1}{2}b\)  iii \(\frac{1}{2}a + \frac{1}{2}b\)  b  \(-\frac{1}{2}a + \frac{1}{2}b\)  c  \(-\frac{1}{2}a + \frac{1}{2}b\)  c  \(-\frac{1}{2}a + \frac{1}{2}b\)  

9. a i \(-\frac{1}{2}a + \frac{1}{2}b\)  ii \(-\frac{1}{2}a + \frac{1}{2}b\)  iii \(-\frac{1}{2}a + \frac{1}{2}b\)  iv \(-\frac{1}{2}a + \frac{1}{2}b\)  c  \(-\frac{1}{2}a + \frac{1}{2}b\)  c  \(-\frac{1}{2}a + \frac{1}{2}b\)  c  \(-\frac{1}{2}a + \frac{1}{2}b\)  

10. a  b  c  d  e  f  g  h  i  j  

11. a Any 3 of \(\overrightarrow{AD}, \overrightarrow{AE}, \overrightarrow{ED}, \overrightarrow{EF}\)  b Any 3 of \(\overrightarrow{BD}, \overrightarrow{BE}, \overrightarrow{EF}, \overrightarrow{ED}\)  c Opposite direction and \(\overrightarrow{AB} = -\overrightarrow{CD}\)  d Opposite direction and \(\overrightarrow{AB} = -\overrightarrow{CD}\)  

12. Parts b and d could be, parts a and c could not be 

13. a Any multiple (positive or negative) of \(3a - b\)  b Will be a multiple of \(3a - b\)
Quick check

Exercise 26A

1 a–d e Stretch sf in y-direction: 3, ½, 10

2 a–d e b Translation \( \begin{pmatrix} 0 \\ 3 \end{pmatrix} \) c Translation \( \begin{pmatrix} 0 \\ 1 \end{pmatrix} \) d Stretch sf 2 in y-direction, followed by translation \( \begin{pmatrix} 0 \\ 1 \end{pmatrix} \)

3 a–d e b Translation \( \begin{pmatrix} -3 \\ 0 \end{pmatrix} \) c Translation \( \begin{pmatrix} 1 \\ 0 \end{pmatrix} \) d Stretch sf 2 in y-direction, followed by translation \( \begin{pmatrix} 2 \\ 0 \end{pmatrix} \)

4 a–c d b Translation \( \begin{pmatrix} -3 \\ -1 \end{pmatrix} \) c Translation \( \begin{pmatrix} 1 \\ 3 \end{pmatrix} \) followed by stretch sf 4 in y-direction

5 a–d

- Reflection in $x$-axis, followed by translation $\begin{pmatrix} 0 \\ 3 \end{pmatrix}$
- Reflection in the $x$-axis, followed by stretch sf 3 in $y$-direction
- Reflection in $x$-axis, followed by stretch sf 2 in $y$-direction and translation $\begin{pmatrix} 0 \\ 1 \end{pmatrix}$

6 a–d

- Stretch sf 1–3 in $x$-direction
- Stretch sf 2 in $x$-direction
- Stretch sf 5 in $y$-direction, followed by stretch sf 1–2 in $x$-direction

7 a–d

- Stretch sf $\frac{1}{2}$ in $x$-direction
- Stretch sf 2 in $x$-direction
- Stretch sf 5 in $y$-direction, followed by stretch sf $\frac{1}{2}$ in $x$-direction

8 a–d

- Stretch sf in $y$-direction: $2, \frac{1}{2}, 10$
- Translate $\begin{pmatrix} -90 \\ 0 \end{pmatrix}$
- Translate $\begin{pmatrix} 40 \\ 0 \end{pmatrix}$
- Stretch sf 2 in $y$-direction followed by translation $\begin{pmatrix} 90 \\ 0 \end{pmatrix}$

9 a–d

- Stretch sf 2 in $y$-direction followed by translation $\begin{pmatrix} 0 \\ 2 \end{pmatrix}$
- Translate $\begin{pmatrix} 0 \\ -3 \end{pmatrix}$
- Stretch sf 2 in $y$-direction followed by translation $\begin{pmatrix} 0 \\ 1 \end{pmatrix}$
10 a–d e  

\[ y = \sin x \]  
\[ y = -\sin x \]

b Reflection in x-axis  
c Reflection in y-axis  
d This leaves the graph in the same place and is the identity transform.

11 a–d e  

\[ y = \cos x + 2 \]  
\[ y = 2 \cos x \]  
\[ y = \cos x \]  
\[ y = \cos (x - 60°) \]

b Stretch sf 2 in y-direction  
c Translation \( \left( \frac{60}{2} \right) \)  
d Translation \( \left( 0, \frac{1}{2} \right) \)

12 a i Stretch sf 4 in y-direction  
ii Stretch sf 9 in y-direction  
iii Stretch sf 16 in y-direction  
b i Stretch sf \( \frac{1}{2} \) in x-direction  
ii Stretch sf \( \frac{1}{2} \) in x-direction  
iii Stretch sf \( \frac{1}{2} \) in x-direction  
c Stretch sf \( a^2 \) in y-direction, or stretch sf \( \frac{1}{a} \) in x-direction

13 a b c d e f

14 a \[ y = 5x^2 \]  
b \[ y = x^2 + 7 \]  
c \[ y = (x + 3)^2 \]  
d \[ y = 3x^2 + 4 \]  
e \[ y = (x + 2)^2 - 3 \]  
f \[ y = -3x^2 \]

15 a \[ y = 6 \cos x \]  
b \[ y = \cos x + 3 \]  
c \[ y = \cos (x + 30°) \]  
d \[ y = 3 \cos x - 2 \]  
e \[ y = \cos (x - 45°) - 2 \]

16 a b i ii iii iv

\[ y = x^3 \]  
\[ y = -x^3 \]  
\[ y = x^3 - 2 \]  
\[ y = 3x^3 \]  
\[ y = (x + 2)^3 \]
17 a

\[ y = x^2 + 2 \]

b i

\[ y = \frac{1}{x} + 4 \]

\[ y = \frac{1}{x - 4} \]

c i

\[ y = \frac{3}{x} \]

\[ y = \frac{1}{2x} \]

18 a

\[ y = x^2 + 2 \]

b

\[ y = (x - 2)^2 \]

c

\[ y = 2x^2 \]

d

\[ y = -x^2 + 4 \]

19 a

\[ y = 2 \sin x \]

b

\[ y = \sin(x - 30^\circ) \]

c

\[ y = 2 \sin(x - 60^\circ) \]

d

\[ y = \sin 2x \]

20 a

Translation \((0, -90)\)

b

i Equivalent

ii Equivalent

iii Not equivalent

21 i A

ii D

iii E

iv C

v B

Quick check

1 \[ z = x + y \]

2 \[ p^2 = q^2 + r^2 \]
